Course overview

Greetings and welcome to Introduction to Data Science! In this course, we will delve into the computational aspects of data analysis, covering topics such as data acquisition, management, and visualization tools. Throughout this course, we will emphasize the principles of data-scientific, reproducible research and dynamic programming, utilizing the R/RStudio ecosystem.

If you have taken Stat 120, 230, or 250 at Carleton, you will find yourself well-equipped to handle the material. However, it is important to refresh your R and R-markdown skills before the start of the class. Specifically, I expect all students to be able to load a data set into R, calculate basic summary statistics, and perform basic exploratory data analysis. In the first week of class, we will delve into Git and GitHub version control, though prior exposure to these topics is not necessary.

0.1 Learning Objectives

- Develop research questions that can be answered by data. Import/scrape data into R and reshape it to the form necessary for analysis.
- Manipulate common types of data, including numeric, categorical (factors), text, date-times, geo-location variables in order to provide insight into your data and facilitate analysis.
- Explore data using both graphical and numeric methods to provide insight and uncover relationships/patterns.
- Utilize fundamental programming concepts such as iteration, conditional execution, and functions to streamline your code.
- Build, tune, use, and evaluate basic statistical learning models to uncover clusters and classify observations.
- Draw informed conclusions from your data and communicate your findings using both written and interactive platforms.

0.2 Course Requirements

8 CONTENTS

Set-up Instructions

Chapter 1

What is R, RStudio, and RMarkdown?

R is a free and open source statistical programming language that facilitates statistical computation. There are a myriad of application that can be done in R, thanks to a huge online support community and dedicated packages. However, R has no graphical user interface and it has to be run by typing commands into a text interface.

1.1 What is RStudio?

RStudio provides graphical interface to R! You can think of RStudio as a graphical front-end to R that that provides extra functionality. The use of the R programming language with the RStudio interface is an essential component of this course.

1.2 R Studio Server

The quickest way to get started is to go to https://maize2.mathcs.carleton.edu, which opens an R Studio window in your web browser. Once logged in, I recommend that you do the following:

- Step 1: Create a folder for this course where you can save all of your work. In the Files window, click on New Folder.
- Step 2: Click on Tools -> Global Options -> R Markdown. Then uncheck the box that says "Show output inline..."

(It is also possible to download RStudio on your own laptop. Instructions may be found at the end of this document.)

1.3 R/RStudio

The use of the R programming language with the RStudio interface is an essential component of this course. You have two options for using RStudio:

- The server version of RStudio on the web at (https://maize2.mathcs. carleton.edu). The advantage of using the server version is that all of your work will be stored in the cloud, where it is automatically saved and backed up. This means that you can access your work from any computer on campus using a web browser. This server may run slow during peak days/hours. I also recommend you to download a local version of R server in your computer in case of rare outages.
- A local version of RStudio installed on your machine. This option is highly recommended due to the computational resources this course demands. Using this version you can only store your files in your local machine. Additionally, we can save our work on GitHub. We will learn how to use GitHub in the beginning of the course. Both R and RStudio are free and open-source. Please make sure that you have recently updated both R and RStudio.

1.4 Installing R/RStudio (not needed if you are using the maize server)

Download the latest version of R: https://cran.r-project.org/ Download the free Rstudio desktop version: https://www.rstudio.com/products/rstudio/download/

Use the default download and install options for each. For R, download the "precompiled binary" distribution rather than the source code

Updating R/RStudio (not needed if you are using the maize server)

If you have used a local version of R/RStudio before and it is still installed on your machine, then you should make sure that you have the most recent versions of each program.

• To check your version of R, run the command getRversion() and compare your version to the newest version posted on https://cran.r-project.org/. If you need an update, then install the newer version using the installation directions above.

• In RStudio, check for updates with the menu option Help > Check for updates. Follow directions if an update is needed.

** Did it work? (A sanity check after your install/update) **

Do whatever is appropriate for your operating system to launch RStudio. You should get a window similar to the screenshot you see here, but yours will be more boring because you haven't written any code or made any figures yet!

Put your cursor in the pane labeled Console, which is where you interact with the live R process. Create a simple object with code like x <-2*4 (followed by enter or return). Then inspect the x object by typing x followed by enter or return. You should see the value 8 printed. If this happened, you've succeeded in installing R and RStudio!

1.5 What is RMarkdown?

An R Markdown file (.Rmd file) combines R commands and written analyses, which are 'knit' together into an HTML, PDF, or Microsoft Word document.

An R Markdown file contains three essential elements:

- Header: The header (top) of the file contains information like the document title, author, date and your preferred output format (pdf_document, word_document, or html_document).
- Written analysis: You write up your analysis after the header and embed R code where needed. The online help below shows ways to add formatting details like bold words, lists, section labels, etc to your final pdf/word/html document. For example, adding ** before and after a word will bold that word in your compiled document.
- R chunks: R chunks contain the R commands that you want evaluated.
 You embed these chunks within your written analysis and they are evaluated when you compile the document.

1.6 Install LaTeX (for knitting R Markdown documents to PDF):

You need a Latex compiler to create a pdf document from a R Markdown file. If you use the maize server, you don't need to install anything. If you are using a local RStudio, you should install a Latex compiler. Below are the recommended installers for Windows and Mac:

- MacTeX for Mac (3.2GB)
- MiKTeX for Windows (190MB)
- Alternatively, you can install the tinytex R package by running install.packages("tinytex") in the console.

1.7 Updating R/RStudio (not needed if you are using the maize2 server)

If you have used a local version of R/RStudio before and it is still installed on your machine, then you should make sure that you have the most recent versions of each program.

- To check your version of R, run the command getRversion() and compare your version to the newest version posted on https://cran.r-project.org/. If you need an update, then install the newer version using the installation directions above.
- In RStudio, check for updates with the menu option Help > Check for updates. Follow directions if an update is needed.

1.8 Opening a new file

If using Rstudio on your computer, using the File>Open File menu to find and open this .Rmd file.

If using Maize Rstudio from your browser:

- In the Files tab, select **Upload** and **Choose File** to find the .Rmd that you downloaded. Click *OK* to upload to your course folder/location in the maize server account.
- Click on the .Rmd file in the appropriate folder to open the file.

1.9 Running codes and knitting .Rmd files:

- You can run a line of code by placing your cursor in the line of code and clicking Run Selected Line(s)
- You can run an entire chunk by clicking the green triangle on the right side of the code chunk.

- After each small edit or code addition, **Knit** your Markdown. If you wait until the end to Knit, it will be harder to find errors in your work.
- Format output type: You can use any of pdf_document, html_document type, or word_document type.
- Maize users: You may also need to allow for "pop-up" in your web browser when knitting documents.

1.10 Few More Instructions

The default setting in Rstudio when you are running chunks is that the "output" (numbers, graphs) are shown **inline** within the Markdown Rmd. If you prefer to have your plots appear on the right of the console and not below the chunk, then change the settings as follows:

- 1. Select Tools > Global Options.
- 2. Click the R Markdown section and uncheck (if needed) the option Show output inline for all R Markdown documents.
- 3. Click OK.

Now try running R chunks in the .Rmd file to see the difference. You can recheck this box if you prefer the default setting.

1.11 VPN

If you plan to do any work off campus this term, you need to install Carleton's VPN. This will allow you to access the **maize** server (if needed).

Installing the GlobalProtect VPN

Follow the directions here to install VPN.

Chapter 2

Assignments in Stat 220

2.1 Do's and Don't of collaboration for individual assignments

- You can discuss homework problems with classmates but you must write up your own homework solutions and do your own work in R (no sharing commands or output).
 - Do not share R commands/code in any way, including, but not limited to, sending commands via email, slack, text, or showing commands in a shared screen with the intention of showing a classmate your solution to a problem.
 - You **can** share a screen to help troubleshoot a coding problem in R.
- You can use the following resources to complete your homework:
 - Carleton faculty (myself, other math or statistics faculty, etc)
 - discussions with classmates (see above) or knowledgeable friends
 - Carleton resources like stats lab assistants
 - student solutions provided in the back of your student textbook or in the student solution manual.
- You *cannot* use any resources other than the ones listed above to complete assignments (homework, reports, etc) for this class. (e.g. you cannot use a friend's old assignments or reports, answers found on the internet, textbook (instructor) solutions manual, etc.)

2.1.1 Examples that violate the academic integrity policy

• sending your .Rmd homework file to another person in the class

- receiving an .Rmd homework file from another person
- sharing a screen and copying code, verbatim, from another person
- sending/receiving R commands
- neglecting to acknowledge classmates with whom you worked with on an assignment

2.2 Format and Content

Submit via GitHub (for most assignments) an organized and correctly ordered assignment.

- Content: Good data scientists need to do more than just write code; they should be able to interpret and explain their analyzes.
 - Provide a written answer first, followed by any required R code and output.
 - Use complete sentences when answering any problem that requires an explanation or overall problem summary.
- When including code:
 - Be sure to show the natural sequence of work needed to answer the problem.
 - Include brief comments explain your code steps.
 - Do not include typos or unnecessary commands/output.
 - Always include code output.
- At the top of each individual assignment include the names of classmates that you worked with on all or part of the assignment (but each person must write up their assignment on their own)

Disability Accommodations: Carleton College is committed to providing equitable access to learning opportunities for all students. The Disability Services office (Henry House, 107 Union Street) is the campus office that collaborates with students who have disabilities to provide and/or arrange reasonable accommodations. If you have, or think you may have, a disability (e.g., mental health, attentional, learning, autism spectrum disorders, chronic health, traumatic brain injury and concussions, vision, hearing, mobility, or speech impairments), please contact disability@carleton.edu or call Sam Thayer ('10), Accessibility Specialist (x4464) or Chris Dallager, Director of Disability Services (x5250) to arrange a confidential discussion regarding equitable access and reasonable accommodations.

Academic Honesty: All work that you turn in under your name must follow Carleton's academic integrity policy. The use of textbook solution manuals (physical or online solutions), homework, reports or exams done by past students are not allowed. Look at the College's Writing Across the Curriculum website for additional guidance on plagiarism and how to avoid plagiarism in their writing.

Chapter 3

Software in Stat 220

You will work with many .Rmd Markdown files in this course. These include class activities, homework template, project helper files etc. To stay organized, I *strongly* suggest you create a **stat220** folder that contains the following subfolders:

• stat220 folder

- Assignments: This folder will contain subfolders for each assignment. Each assignment subfolder (e.g. homework1, homework2, ...)
 will be a Github connected RStudio project that you will create once an assignment is posted.
- Content: This folder should be used to save any non-assignment files (e.g. slides, examples) for this class. You will create this subfolder by creating an RStudio project (see step 5 below).

To get started with this organization, follow the steps below.

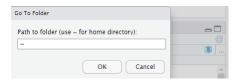

3.1 File organization: Using maize

The server (online) version of Rstudio is run from a unix server. You can navigate this file system using unix commands, but I assume that most or all of you will just use Rstudio to access your files on this server.

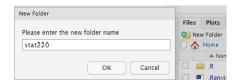

1. In Rstudio, click the **Files** tab in the lower right-hand window. Note: this is **not** the same as the **File** menu option.

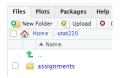

2. Verify that you are in your **HOME** folder (should simply say Home right under the New Folder button). To navigate to your Home folder (if somehow you are not in it), click the ... button (far right side of the **Files** tab) and enter a ~ (tilde) symbol

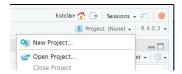

• 3. Click the New Folder button and name the folder stat220.

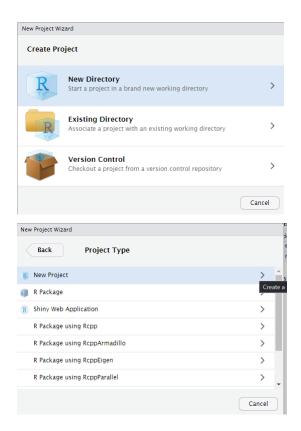

• 4. Click on this newly created (empty) stat220 folder. Within the folder create another New Folder and name it assignments.

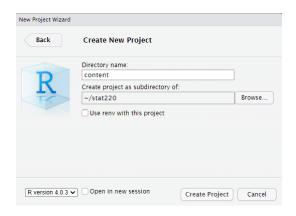

- 5. Within the stat220 folder, create an RStudio project called content with the following steps:
 - a. Click the **Project** button in the upper righthand corner of your RStudio window and select **New Project...**.

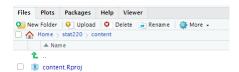

• b. Select New Directory and then New Project

• c. Enter content as the **Directory name** and use the **Browse** button to find your stat220 folder. Then click **Create Project**.

• d. You should now have a new folder called **content** in your **stat220** folder and this folder will contain an RStudio project .Rproj. Feel free to add subfolders to this **content** folder (e.g. slides, examples, etc).

Warning: Do not create an RStudio project in the main stat220 folder because it is not good practice to have RStudio projects in subfolders of another project (e.g. a project within a project is not recommended).

3.2 File organization: Using your own Rstudio

Create a folder called **stat220** somewhere on your computer. Within this folder create an **assignments** subfolder. Then complete **step 5** from above to create a **content** RStudio project folder.

3.3 RStudio projects

Once you've created a project, your R session should be running within that project folder. You can check which project you are in by checking the project name in the upper righthand part of your RStudio window. Here we see the **content** project is open:

Running R from an RStudio project sets your **working directory** to the project folder:

```
> getwd()
[1] "/Accounts/kstclair/stat220/content"
```

This allows for easy file path access to all files related to this project.

To start a project, click on the .Rproj file or use the Open Project... option shown in step 5 above.

3.4 Best practices (or what not to do)

- Never save files to a lab computer hard drive (e.g. desktop, downloads, etc). They will be erased when you log off.
- Do not use gmail as a file storage system! Avoid emailing yourself files that you created (and saved) on a lab computer. Eventually you will lose work this way.
- Avoid using online versions of google drive and dropbox. Similar to gmail, downloading, editing a doc, then uploading it back to drive/dropbox is another great way to lose work.
- Avoid this and this.

3.5 Git and GitHub

Git is version control software that you install locally on your computer. Git is already installed on the maize RStudio server.

Github is a cloud-based service for hosting git projects. It allows multiple users to share and contribute to projects and it is how you will be submitting homework assignments and projects for this class. More information about Git and Github can also be found in Getting setup with Git and GitHub and Git and Github.

If you are using a local install of R/RStudio, then you will need to install Git.

Installing Git

Directions for both Windows & Mac here: $\label{lem:http://happygitwithr.com/install-git.html.} http://happygitwithr.com/install-git.html.$

- 1. If you are using **maize**, then there is nothing you need to install.
- 2. Windows users should follow Option 1 in 6.2.
- 3. Mac users can follow Option 1 in 6.3 if comfortable, otherwise follow Option 2 $\,$
- 4. Linux users can follow 6.4.

3.6 Slack

We will use Slack for all course communication. Sign up for our course Slack team here! You will need to create an account with a username, and log in to read and post. You can download a standalone Slack application to your Mac, Windows, Linux and/or Android/iOS device. You can control whether you receive notifications on new posts by going to Preferences, as well as decide which 'channels' to subscribe to. A 'channel' is a discussion thread, which is used to organize communications into topics. You can learn more about Slack features here.

Several channels have been set up for specific parts of the course. Feel free to ask questions anytime. You can browse the available channels in our team by clicking on "Channels" on the left-hand panel.

3.7 Acknowledgements

This installation guide is based on the guide from Adam Loy and Katie St. Clair.

Chapter 4

GitHub Guide for Students in Stat 220

4.1 Overview

If you are using the maize RStudio server, then you can connect to GitHub without any extra software downloads. If you are using RStudio on your computer, then you will need to download Git software (as directed in Software in Stat 220) to use GitHub connected projects. You will use GitHub to submit homework and collaborate on projects.

4.2 Getting setup with Git and GitHub

If you are **not** working on the maize RStudio server, then make sure that you have installed all of the software mentioned in Software in Stat 220. In addition, you should install the usethis and gitcreds R packages.

Everyone needs to connect Git and GitHub by doing the following:

- 1. Register for account on GitHub (https://github.com/). I recommend using a username that incorporates your name (e.g., dbastola) and Carleton email address for your Github account.
- 2. If you haven't done so already, accept the invite to the class organization DataScienceSpring23. This organization is where all course homework files and project repositories will live.
- 3. Setup options in Git by running the following code chunk in your console:

```
#install.packages("usethis") # uncomment to install
usethis::use_git_config(user.name = "Jane Doe", user.email = "jane@example.org")
```

changing the first two arguments to your own name and email (this should be the email associated with your GitHub account).

4. In order to push changes to github (i.e. to track changes and submit homework), you will need to prove that you have permission to change a Github repo. This is done with a personal access token (PAT). Note that you will need to install the packages usethis and gitcreds to do this.

```
usethis::create_github_token()
```

```
Call `gitcreds::gitcreds_set()` to register this token in the local Git credential It is also a great idea to store this token in any password-management software to Opening URL 'https://github.com/settings/tokens/new?scopes=repo,user,gist,workf
```

"Generate token" and store your tokens somewhere safe in your local computer as you will need this again in the future. You can additionally add PAT to your .Renviron file as well. Copy it and paste it into your .Renviron file as system variable GITHUB_PAT using

```
usethis::edit_r_environ()
```

Add to the file and save. You can also set the PAT token in R using the following.

```
#install.packages("gitcreds") # uncomment to install
gitcreds::gitcreds_set()
```

You can check that you've stored a credential with gitcreds_get():

```
gitcreds::gitcreds_get()
```

You should get something like this:

```
#> <gitcreds>
#> protocol: https
#> host : github.com
#> username: PersonalAccessToken
#> password: <-- hidden -->
```

Treat your PAT token like a password! For details, follow the step in Section 9.1 on this page to do this: https://happygitwithr.com/https-pat.html.

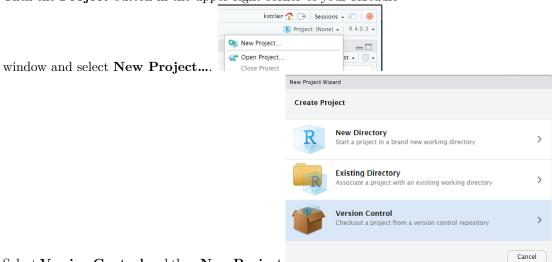

4.3 Individual assignments

If you followed the suggestions in the File organization in RStudio page, then you should already have an assignments folder on your computer or maize account.

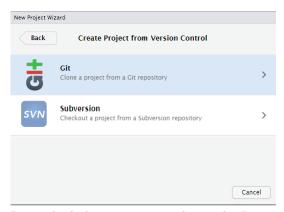

Each new assignment/project will be posted as a repository on GitHub and added directly to your account (within the Stat220 organization). This repository will contain assignment details (README, .Rmd).

4.3.1 Creating an individual assignment repo and project

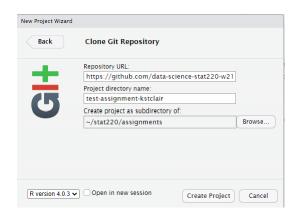

- 1. Go to our course GitHub organization page (DataScienceSpring23) and find your homework repo, such as hw1-username (where your username is attached).
- 2. Enter the online assignment repository on GitHub. Click the green "Code" button. Most of you should just use the default setting which is to "clone" (copy) using HTTPS. Click the clipboard to the right of the URL to copy the repo location.
- 3. Now open up RStudio and create a project as follows:
 - Click the **Project** button in the upper right corner of your RStudio

• Select Version Control and then New Project

• Paste the link you just copied into the Repository URL box. Leave the Project directory name blank (or keep the auto-filled name). Use the **Browse** button to find your **assignments** folder, then click **Create Project**

4.3.2 Working on your assignment

An RStudio project should now open, which will allow you to start working on your homework assignment. You should see the project assignment name in the top right side of Rstudio. You will probably see a blank console screen when you open a new project. Look in the Files tab for your homework .Rmd file. Click on whatever file you want to edit (probably the .Rmd file) and edit away. Make sure that your current assignment's project is the one open and showing in the upper rightproject name. To **open** a project, click on the .Rproj file or use the **Open Project...** option available in the upper right project link.

4.3.2.1 Commits

After you make changes to the homework assignment, commit them. What are commits you ask? Commits are essentially taking a snapshot of your projects. Commits save this snapshot to your local version of Git (located on your hard drive or the maize server). For example, if I make changes to a code so that it prints "Hello world", and then commit them with an informative message, I can look at the history of my commits and view the code that I wrote at that time. If I made some more changes to the function that resulted in an error, I could go back to the commit where the code was originally working. This prevents you from creating several versions of your homework (homework-v1, homework-v2, ...) or from trying to remember what your code originally looked like.

You can make commits in the Git tab in RStudio.

Click the **Commit** button in the Git tab. Check the boxes of the files that you want to commit, enter your commit message (briefly state what changes have been made), then hit **Commit**. You can read how to do this in RStudio in more detail here: http://r-pkgs.had.co.nz/git.html#git-commit.

Two things about committing.

- You should **commit somewhat frequently**. At minimum, if you're doing a homework assignment, you should make a commit each time that you've finished a question.
- Leave informative commit messages. "Added stuff" will not help you if you're looking at your commit history in a year. A message like "Added initial version of hello-world function" will be more useful.

4.3.2.2 Pushing changes to Github

At some point you'll want to get the updated version of the assignment back onto GitHub, either so that we can help you with your code or so that it can be graded. You will also want to push work frequently when you have a shared GitHub repo for project collaborations (i.e. more than one person is working on a project and code). If you are ready to push, you can again click on the "Up" **Push** arrow in the Git tab or in the Commit pop-up window or in the Git tab (shown above).

To "turn in" an assignment, all you need to do is push all your relevant files to Github by the deadline.

4.4 Group work

Collaborative Github assignments are pretty similar to individual assignments.

4.4.1 Creating a group/partner assignment repo and project

Go to our course GitHub organization page(DataScienceSpring23) and find the repo for your group, for example if your group name is "team01" the you might find the mp1-team01 repo. Clone this repo to your computer/maize account using the same steps done for an individual assignment (see steps 2-3).

4.4.1.1 Working with collaborative repos

For group homework, I suggest that only the *recorder* edit the group-homework-x.Rmd file to avoid merge conflicts! Other group members can create a new Markdown doc to run and save commands. Only the recorder needs to **push** changes (answers) to the Github repo and all others can then **pull** these changes (i.e. the final answers) after the HW is submitted.

When you are working together on a Github project, you should commit and push your modifications frequently. You will also need to frequently **pull** updates from Github down to your local version of RStudio. These updates are changes that your teammates have made since your last pull. To pull in changes, click the "Down" **Pull** arrow in the Git tab (shown above).

If you get an error about conflict after pulling or pushing, don't freak out! This can happen if you edit a file (usually an .Rmd or .R file) in a location that was also changed by a teammate. When this happens you should attempt to fix the **merge conflict**. Take a look at this resource site and try to fix the merge conflict in Rstudio.

Chapter 5

R Markdown Syntax

Markdown is a simple formatting syntax for authoring HTML, PDF, and MS Word documents. For more details on using R Markdown see http://rmarkdown.rstudio.com.

5.0.1 Lists in R Markdown:

You can use asterisk mark to provide emphasis, such as *italics* or **bold**. You can create lists with a dash:

```
- Item 1
- Item 2
- Item 3
+ Subitem 1
* Item 4
```

to produce

- Item 1
- Item 2
- Item 3
 - Subitem 1
- Item 4

You can embed Latex equations in-line, $\frac{1}{n} \sum_{i=1}^{n} x_i$ or in a new line as $\frac{1}{n-1} \sum_{i=1}^{n} x_i$ or in a new line as $\frac{1}{n-1} \sum_{i=1}^{n} x_i$ or in a new line as $\frac{1}{n-1} \sum_{i=1}^{n} x_i$ or in a new line as $\frac{1}{n-1} \sum_{i=1}^{n} x_i$ or in a new line as $\frac{1}{n-1} \sum_{i=1}^{n} x_i$ or in a new line as $\frac{1}{n-1} \sum_{i=1}^{n} x_i$ or in a new line as $\frac{1}{n-1} \sum_{i=1}^{n} x_i$ or in a new line as $\frac{1}{n-1} \sum_{i=1}^{n} x_i$ or in a new line as $\frac{1}{n-1} \sum_{i=1}^{n} x_i$ or in a new line as $\frac{1}{n-1} \sum_{i=1}^{n} x_i$ or in a new line as $\frac{1}{n-1} \sum_{i=1}^{n} x_i$ or in a new line as $\frac{1}{n-1} \sum_{i=1}^{n} x_i$ or in a new line as $\frac{1}{n-1} \sum_{i=1}^{n} x_i$

$$Var(X) = \frac{1}{n-1} \sum_{i=1}^{n} (x_i - \bar{x})^2$$

5.0.2 Embed an R code chunk:

```
Use the following
```

```
Use back ticks to create a block of code to produce:

Use back ticks to create a block of code
```

You can also evaluate and display the results of R code. Each tasks can be accomplished in a suitably labeled chunk like the following:

```
summary(cars)
```

```
speed
                   dist
Min.
     : 4.0
              Min. : 2.00
1st Qu.:12.0
              1st Qu.: 26.00
Median:15.0
              Median : 36.00
      :15.4
                    : 42.98
Mean
              Mean
3rd Qu.:19.0
              3rd Qu.: 56.00
Max.
      :25.0
                     :120.00
              Max.
```

```
fit <- lm(dist ~ speed, data = cars)
fit</pre>
```

```
Call:
```

```
lm(formula = dist ~ speed, data = cars)
```

Coefficients:

```
(Intercept) speed
-17.579 3.932
```

5.0.3 Including Plots:

You can also embed plots. See Figure 5.1 for example:

```
par(mar = c(0, 1, 0, 1))
pie(
  c(280, 60, 20),
  c('Sky', 'Sunny side of pyramid', 'Shady side of pyramid'),
  col = c('#0292D8', '#F7EA39', '#C4B632'),
  init.angle = -50, border = NA
)
```

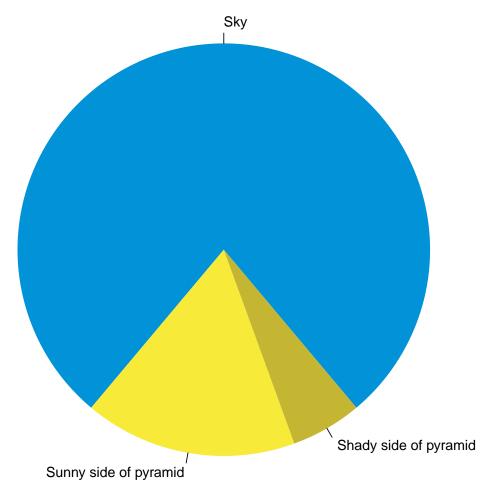

Figure 5.1: A fancy pie chart.

(Credit: Yihui Xie)

5.0.4 Read in data files:

```
simple_data <- read.csv("https://deepbas.io/data/simple-1.dat", )
summary(simple_data)</pre>
```

initials	state		age
Length:3	Length:3	Min	. :45.0
Class :characte	er Class :ch	naracter 1st	Qu.:47.5
Mode :characte	er Mode :ch	naracter Medi	ian :50.0
		Mear	i :52.0
		3rd	Qu.:55.5
		Max	•61 0

time Length:3

Class :character
Mode :character

knitr::kable(simple_data)

initials	state	age	time
vib	MA	61	6:01
adc	TX	45	5:45
kme	CT	50	4:19

5.0.5 Hide the code:

If we enter the $\mbox{echo} = \mbox{FALSE}$ option in the R chunk (see the .Rmd file). This prevents the R code from being printed to your document; you just see the results.

initials	state	age	time
vib	MA	61	6:01
adc	TX	45	5:45
kme	CT	50	4:19

Class Activities

Chapter 6

Class Activity 0

```
# load the required libraries
library(credentials) # to help with PAT access
library(gitcreds)
library(usethis)

# STEPS INVOLVED TO ESTABLISH GIT CREDENTIALS / PAT

# Step 1

# usethis::use_git_config(user.name = "deepbas", user.email = "deepbas99@gmail.com")

# Step 2

# usethis::create_github_token()

# Step 3

# if this is the second/subsequent iteration start from here

# gitcreds::gitcreds_set()

# Verify

# gitcreds::gitcreds_get()
```

In this worksheet, you will practice creating a GitHub repository using the usethis::use_github() function and cloning it back to your local machine using RStudio's menu options.

6.1 Tutorial 1: Creating and cloning a Repository starting from Github to RStudio

- Visit the GitHub website at https://github.com and sign in using your GitHub account. If you don't have an account yet, you can create one for free.
- 2. Once logged in, click on the "+" icon in the top right corner of the webpage, then click on "New repository".
- 3. Enter a name for your new repository in the "Repository name" field. You may also provide an optional description.
- 4. Choose the visibility of your repository by selecting either "Public" or "Private". Public repositories are visible to anyone, while private repositories are only visible to you and any collaborators you invite.
- 5. (Optional) Check the box to initialize the repository with a README file.
- 6. Click on the "Create repository" button to create your new repository.

This will create a new GitHub repository on your Github account. Follow further to clone the repository to your local folder using RStudio.

- 1. Go to your GitHub repository webpage and click on the green "Code" button. This will display a dropdown menu with a URL for your repository. Click on the clipboard icon to copy the URL to your clipboard.
- 2. Open RStudio, and from the "File" menu, select "New Project".
- 3. In the "New Project" dialog, choose "Version Control".
- 4. Select "Git" as the version control system.
- 5. In the "Repository URL" field, paste the URL that you copied from your GitHub repository webpage.
- 6. Choose a local directory where you want to clone the repository by clicking on the "Browse" button and navigating to the desired folder on your computer.
- 7. Click on "Create Project" to clone the GitHub repository to your local computer.

6.2 Tutorial 2: Creating a new GitHub repository using usethis R package (RStudio to Github) (Works ONLY on local RStudio)

6.2.1 Prerequisites

- 1. Install the usethis package if you haven't already: install.packages("usethis")
- 2. Make sure you have a GitHub account, and you are logged in.
- 3. Configure Git with your name and email address if you haven't already. Run the following commands in the R console, replacing "Your Name" and "youremail@example.com" with your information:

```
usethis::use_git_config(user.name = "Your Name", user.email = "youremail@example.com")
```

- 4. Create a new R project in RStudio by clicking on "File" > "New Project" > "New Directory" > "New Project." Give your project a name and choose a location on your computer to save it. Click "Create Project."
- 5. Make a new file or copy and paste a .Rmd file that you want to have in your repo and save it to your requirement.
- 6. In the R console, load the usethis package:

library(usethis)

7. Initialize a Git repository for your project by running:

```
usethis::use_git()
```

8. Now, let's create a new GitHub repository using the usethis::use_github() function. Run the following command:

```
usethis::use_github()
```

9. Follow the instructions in the R console, and your GitHub repository will be created. Note the repository URL, as you will need it in the next activity.

6.3 (Optional) Tutorial 3: Creating a new GitHub repository using RStudio's Git terminal

- 1. Create a new R project in RStudio by clicking on "File" > "New Project" > "New Directory" > "New Project." Give your project a name and choose a location on your computer to save it. Click "Create Project."
- 2. Initialize a Git repository for your project. Click on the "Terminal" tab in the bottom right pane of RStudio and run the following command:

git init

3. Configure Git with your name and email address if you haven't already. Run the following commands in the terminal, replacing "Your Name" and "youremail@example.com" with your information:

```
git config user.name "Your Name"
git config user.email "youremail@example.com"
```

4. Commit your project files to the Git repository. Run the following commands in the terminal:

```
git add .
git commit -m "Initial commit"
```

- 5. Go to your GitHub account, click on the "+" icon in the upper right corner, and select "New repository." Give your repository a name (it's recommended to use the same name as your R project), and click "Create repository."
- 6. In the "...or push an existing repository from the command line" section of your new GitHub repository, copy the commands under this section. It should look similar to the following (replace and with your GitHub username and repository name):

```
git remote add origin https://github.com/<your-username>/<your-repo-name>.git git branch -M main git push -u origin main
```

7. Paste the copied commands into the RStudio terminal and execute them. This will link your local Git repository to the remote GitHub repository and push your initial commit to the GitHub repository.

Chapter 7

Class Activity 1

The R package babynames provides data about the popularity of individual baby names from the US Social Security Administration. Data includes all names used at least 5 times in a year beginning in 1880.

```
#install.packages("babynames") # uncomment to install
library(babynames)
```

Below is the list for first few cases of baby names.

head(babynames)

```
# A tibble: 6 x 5
  year sex name
                         n prop
 <dbl> <chr> <chr>
                    <int> <dbl>
1 1880 F
            Mary
                     7065 0.0724
2 1880 F
            Anna
                      2604 0.0267
3 1880 F
                      2003 0.0205
            Emma
4 1880 F
            Elizabeth 1939 0.0199
5 1880 F
            Minnie
                      1746 0.0179
6 1880 F
                      1578 0.0162
            Margaret
```

1. How many cases and variables are in the dataset babynames?

Answer:

```
dim(babynames)
```

[1] 1924665 5

There are 1924665 cases and 5 variables in the dataset babynames.

Let's use the package tidyverse to do some exploratory data analysis.

```
#install.packages("tidyverse")
                                 # uncomment to install
library(tidyverse)
babynames %>% filter(name=='Aimee')
# A tibble: 150 x 5
    year sex
               name
                                prop
   <dbl> <chr> <chr> <int>
                               <dbl>
 1 1880 F
                        13 0.000133
               Aimee
 2
   1881 F
               Aimee
                        11 0.000111
 3 1882 F
               Aimee
                        13 0.000112
  1883 F
                        11 0.0000916
               Aimee
   1884 F
               Aimee
                        15 0.000109
   1885 F
 6
               Aimee
                        17 0.000120
 7
   1886 F
               Aimee
                        17 0.000111
   1887 F
                        18 0.000116
 8
               Aimee
 9
    1888 F
               Aimee
                        12 0.0000633
10 1889 F
               Aimee
                        16 0.0000846
# ... with 140 more rows
filtered_names <- babynames %>% filter(name=='Aimee')
#install.packages("ggplot2")
                               # uncomment to install
library(ggplot2)
ggplot(data=filtered_names, aes(x=year, y=prop)) +
  geom_line(aes(colour=sex)) +
 xlab('Year') +
 ylab('Prop. of Babies Named Aimee')
```

2. What do you see in the Figure 1? Explain in a few sentences.

Click for answer

Answer:

In Figure 1, we can see the proportion of babies named Aimee by year for both males and females. We notice that the name Aimee has been more popular among females than males throughout the years. There is a peak in popularity around the 1970s for female babies, and then the popularity declines.

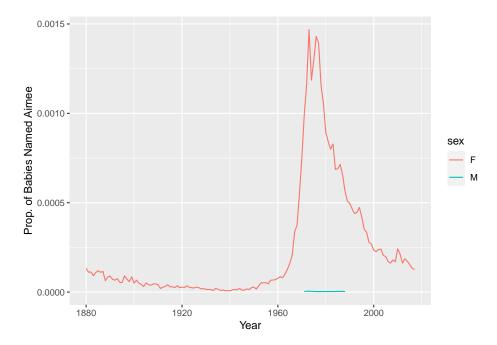

Figure 7.1: A trend chart

3. Repeat question 2 to infer how does the proportion of babies with your first name trend over time. Examine the generated plot and describe the trend of your name's popularity over time. Consider the following points:

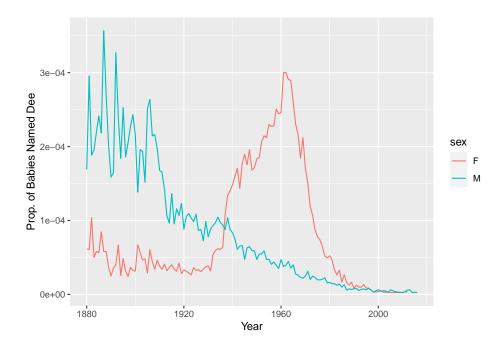

Has the popularity of your name increased, decreased, or remained stable over the years? Is there a noticeable difference in popularity between sexes? Are there any interesting patterns or trends, such as sudden increases or decreases in popularity?

Answer: Answers will vary.

```
# Replace 'YourName' with your first name
your_name <- "Dee"

your_name_data <- babynames %>% filter(name == your_name)

ggplot(data=your_name_data, aes(x=year, y=prop)) +
   geom_line(aes(colour=sex)) +
   xlab('Year') +
   ylab(paste('Prop. of Babies Named', your_name))
```

4. Compare the popularity of your first name with a randomly chosen name from the dataset. Examine the generated plot and compare the popularity of your first name with the randomly chosen name. Consider the following points:

Are there differences in popularity trends between the two names? Is one name consistently more popular than the other, or do their popularity levels change over time? Are there any interesting patterns or trends in the data, such as periods of rapid increase or decrease in popularity?

Answer Answers will vary

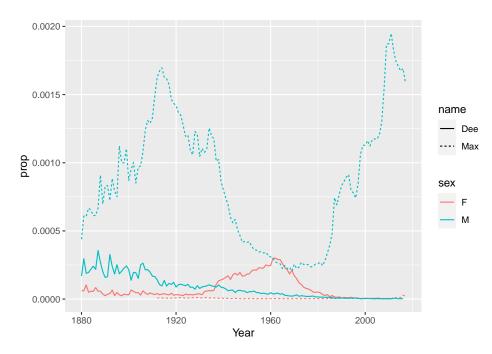

```
# Replace 'YourName' with your first name
your_name_data <- babynames %>% filter(name == 'Dee')

# Replace 'RandomName' with a randomly chosen name from the dataset
random_name_data <- babynames %>% filter(name == 'Max')

# Combine the two datasets
combined_data <- bind_rows(your_name_data, random_name_data)

# Plot the data
ggplot(data=combined_data, aes(x=year, y=prop)) +</pre>
```

7.1 Extras (optional)

7.1.1 Part 1: Setting Working Directory and Loading Data

1. Set your working directory to a folder on your computer where you would like to save your R scripts and data files.

```
# Replace 'your_directory_path' with the path to your desired folder
# setwd("your_directory_path")
```

2. Load the mtcars dataset which comes preloaded with R. This dataset consists of various car features and their corresponding miles per gallon (mpg) values.

```
data(mtcars)
head(mtcars)
```

```
mpg cyl disp hp drat
                                            wt qsec vs am
Mazda RX4
                         6 160 110 3.90 2.620 16.46
                  21.0

                     3
                          1
```

7.1.2 Part 2: Downloading Packages

1. Install the "tidyverse" package, which is a collection of useful R packages for data manipulation, exploration, and visualization.

```
# Uncomment the line below to install the package
# install.packages("tidyverse")
```

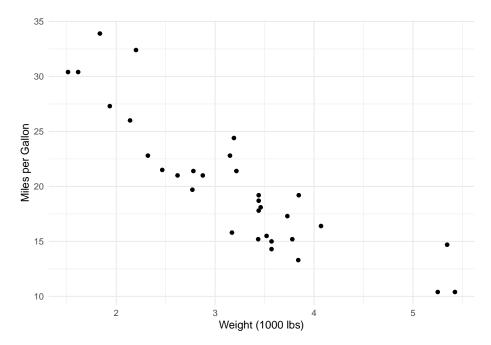

2. Load the "tidyverse" package into your R session.

```
library(tidyverse)
```

7.1.3 Part 3: Creating and Compiling an R Markdown File

- 1. Create a new R Markdown file in RStudio by clicking on "File" > "New File" > "R Markdown...". Save the file in your working directory.
- 2. Add the following code to your R Markdown file to create a scatter plot of the mtcars dataset, showing the relationship between miles per gallon (mpg) and the weight of the car (wt).

```
# Create a scatter plot
ggplot(data = mtcars, aes(x = wt, y = mpg)) +
geom_point() +
xlab("Weight (1000 lbs)") +
ylab("Miles per Gallon") +
theme_minimal()
```

3. Knit your R Markdown file to create an output document. Click the "Knit" button at the top of the RStudio script editor, and choose the output format you prefer (e.g., HTML, PDF, or Word).

7.2 Questions

7.2.1 1. How does the weight of a car (wt) affect its miles per gallon (mpg) based on the scatter plot you created?

Click for answer

Answer:

Based on the scatter plot, there appears to be a negative relationship between the weight of a car (wt) and its miles per gallon (mpg). As the weight of a car increases, its fuel efficiency (mpg) tends to decrease.

7.2.2 2. What is the importance of setting a working directory in R?

Click for answer

Answer:

Setting a working directory in R is important because it determines the default location where R will read from or write to when loading or saving files. This makes it easier to keep your files organized and ensures that your R scripts can access the necessary files without needing to specify the full file paths. It also simplifies sharing your R projects with others since the file paths within your scripts will be relative to the working directory.

7.2.3 3. Explain the role of R Markdown in creating reproducible research documents.

Click for answer

Answer:

R Markdown plays a crucial role in creating reproducible research documents by allowing you to combine text, code, and output (e.g., tables, figures) within a single document. This integration of narrative, data, and results makes it easier to document your data analysis process, ensuring that others can easily understand, reproduce, and build upon your work. R Markdown also supports various output formats (e.g., HTML, PDF, Word) to make it easy to share your research findings with others.

Chapter 8

Class Activity 2

Let's practice some common data assignments and manipulations in R.

a. Create a vector of all integers from 4 to 10, and save it as a1.

Click for answer

```
a1 <- 4:10
a1
```

[1] 4 5 6 7 8 9 10

b. Create a vector of *even* integers from 4 to 10, and save it as a2.

Click for answer

```
a2 <- seq(4, 10, by=2)
a2
```

[1] 4 6 8 10

c. What do you get when you add a1 to a2?

Click for answer

```
a1_plus_a2 <- a1 + a2
a1_plus_a2
```

[1] 8 11 14 17 12 15 18

Answer: When you add a1 to a2, you get a vector containing the element-wise sum: 8, 11, 14, 17, 12, 15, 18.

d. What does the command sum(a1) do?

Click for answer

```
sum_a1 <- sum(a1)
sum_a1</pre>
```

[1] 49

Answer: The command sum(a1) calculates the sum of all elements in the vector a1. In this case, it returns 49.

e. What does the command length(a1) do?

Click for answer

```
length_a1 <- length(a1)
length_a1</pre>
```

[1] 7

Answer: The command length(a1) returns the number of elements in the vector a1. In this case, there are 7 elements.

f. Use the sum and length commands to calculate the average of the values in a1.

Click for answer

```
average_a1 <- sum(a1) / length(a1)
average_a1</pre>
```

[1] 7

Answer: The average of the values in a1 is 7.

8.1 Extras (Optional)

In this worksheet, you will learn how to use the write_csv() function from the readr package to save a data object from your R session to a file in your working directory.

First, let's load the necessary package.

```
library(readr)
```

Suppose we have a simple data frame called my_data, with three columns: Name, Age, and City.

```
Name Age City
Alice 25 New York
Bob 30 Los Angeles
Charlie 22 Chicago
David 35 San Francisco
```

Now we want to save this data frame as a CSV file in our working directory. To do this, we will use the write_csv() function. The first argument is the data object you want to save, and the second argument is the file name (including the .csv extension).

```
write_csv(my_data, "my_data.csv")
```

This command will save my_data as a file called my_data.csv in your working directory.

Question 1: What is the purpose of the write_csv() function?

Click for answer

Answer:

The write_csv() function is used to save a data object from an R session to a CSV file in your working directory.

Question 2: How do you save a data frame called my_data as a file named "example_data.csv"?

Your code here

Click for answer

Answer:

```
write_csv(my_data, "example_data.csv")
```

Question 3: If you want to save a data frame called **students** as a file named "student_data.csv", what would be the appropriate command?

```
# Your code here
```

Click for answer

```
write_csv(students, "student_data.csv")
```

Chapter 9

Class Activity 3

```
# some interesting data objects
x <- c(3,6,9,5,10)
x.mat <- cbind(x, 2*x)
x.df <- data.frame(x=x,double.x=x*2)
my.list <- list(myVec=x, myDf=x.df, myString=c("hi","bye"))</pre>
```

9.1 Question 1: data types

• What data type is x?

Click for answer

Answer:

```
# code
typeof(x)
```

[1] "double"

• What data type is c(x, x/2)?

Click for answer

```
# code
typeof(c(x, x/2))

[1] "double"

• What data type is c(x,NA)? What data type is c(x,"NA")?

Click for answer

Answer:

# code
typeof(c(x, NA))

[1] "double"

typeof(c(x, "NA"))
```

9.2 Question 2: Subsetting and coercion

• How can we reverse the order of entries in x?

Click for answer

Answer:

```
# code
rev(x)
```

[1] 10 5 9 6 3

```
x[length(x):1]
```

[1] 10 5 9 6 3

• What does which(x < 5) equal?

Click for answer

```
# code
which(x<5)</pre>
```

[1] 1

• Extract the element of x that corresponds to the location in the preceding question.

Click for answer

Answer:

```
# code
x[which(x<5)]</pre>
```

[1] 3

• What does sum(c(TRUE,FALSE,TRUE,FALSE)) equal?

Click for answer

Answer:

```
# code
sum(c(TRUE,FALSE,TRUE,FALSE))
```

[1] 2

• What does sum(x[c(TRUE,FALSE,TRUE,FALSE)]) equal?

Click for answer

Answer:

```
# code
sum(x[c(TRUE,FALSE,TRUE,FALSE, TRUE)])
```

[1] 22

• What does sum(x < 5) equal?

Click for answer

```
# code
sum(x < 5)
```

[1] 1

• What does sum(x[x < 5]) equal?

Click for answer

Answer:

```
# code
sum(x[x < 5])
```

[1] 3

• Why dim(x.mat[1:2,1]) return NULL while dim(x.mat[1:2,1:2]) returns a dimension?

Click for answer

Answer:

```
# code
dim(x.mat[1:2,1])
```

NULL

```
dim(x.mat[1:2,1:2])
```

[1] 2 2

9.3 Question 3: Lists

• Using my.list, show three ways to write one command that gives the 3rd entry of variable x in data frame myDf

Click for answer

```
# code
my.list[[1]][3]
[1] 9
my.list[["myVec"]][3]
[1] 9
my.list[1]$myVec[3]
[1] 9
my.list$myVec[3]
[1] 9
  • What class of object does the command my.list[3] return?
```

Click for answer

Answer:

```
# code
class(my.list[3])
```

[1] "list"

• What class of object does the command my.list[[3]] return?

Click for answer

Answer:

```
# code
class(my.list[[3]])
```

[1] "character"

• What class of object does the command unlist(my.list) return? Why are all the entries characters?

Click for answer

code

class(unlist(my.list))

[1] "character"

Chapter 10

Class Activity 4

```
# Load the required libraries
library(tidyverse)
library(ggplot2)
library(datasauRus)
```

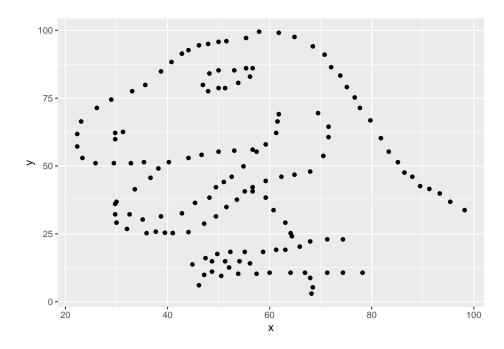

10.1 Your turn 1

This worksheet will guide you through creating various plots using the ggplot2 package in R. We will be using the datasaurus_dozen dataset from the datasauRus package for demonstration purposes. The dataset contains 13 different datasets, and we'll use them to create a variety of plots.

10.1.1 Scatterplot

a. Run the following code.

```
ggplot(data = dino_data, mapping = aes(x = x, y = y)) +
  geom_point()
```

b. You must remember to put the aesthetic mappings in the <code>aes()</code> function! What happens if you forget?

Click for answer

Answer:

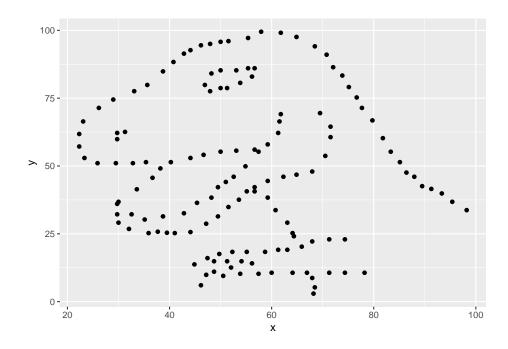

If you forget to put the aesthetic mappings inside the aes() function, ggplot2 will not be able to map the variables to the aesthetics correctly, and you might encounter an error or unexpected behavior in your plot.

```
# Add a layer and see what happens
ggplot(data = dino_data , x = x , y = y)
```

c. The aesthetic mappings can be specified in the geom layer if you prefer, instead of the main ggplot() call. Give it a try:

Click for answer

```
# Rebuild the scatterplot with your aesthetic mapping in the geom layer
ggplot(data = dino_data) +
   geom_point(aes(x = x, y = y))
```

10.1.2 Bar Plot

In this problem, we'll explore creating a bar plot using the ${\tt datasaurus_dozen}$ dataset.

a. Create a new data frame containing the count of observations in each dataset.

Click for answer

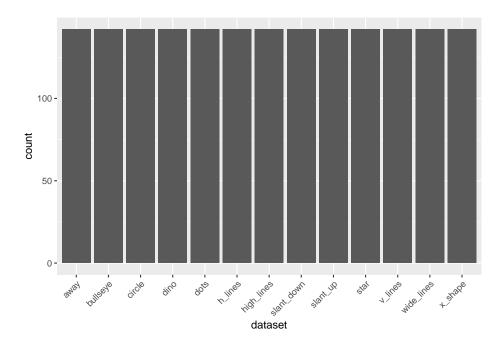

Answer:

```
dataset_counts <- datasaurus_dozen %>%
  group_by(dataset) %>%
  summarise(count = n())
```

b. Create a bar plot showing the number of observations in each dataset.

Click for answer

```
ggplot(data = dataset_counts, aes(x = dataset, y = count)) +
  geom_bar(stat = "identity") +
  theme(axis.text.x = element_text(angle = 45, hjust = 1))
```

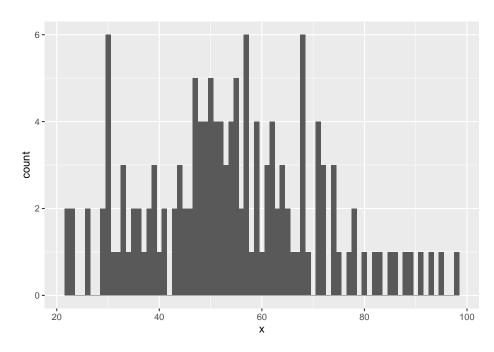

10.1.3 Histogram

a. Create a histogram of the ${\tt x}$ variable for the ${\tt dino}$ dataset.

Click for answer

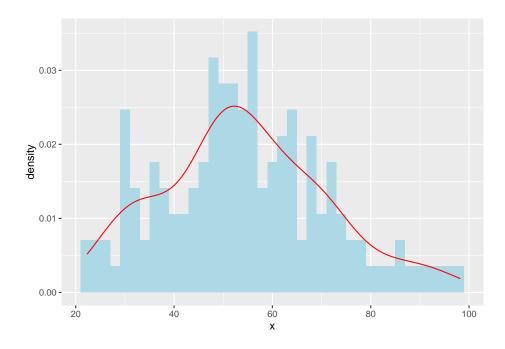

```
ggplot(data = dino_data, aes(x = x)) +
geom_histogram(binwidth = 1)
```

b. Overlay a density curve on the histogram.

Click for answer

```
ggplot(data = dino_data, aes(x = x)) +
  geom_histogram(aes(y = after_stat(density)), binwidth = 2, fill = "lightblue") +
  geom_density(color = "red")
```

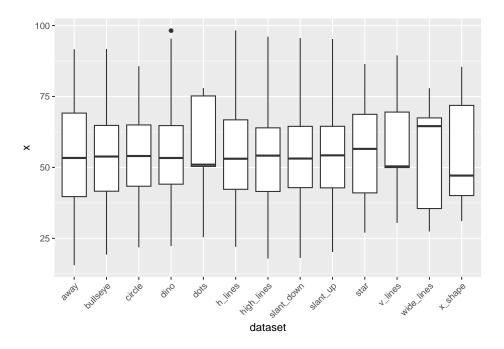

10.1.4 Boxplot

a. Create a boxplot of the x variable for each dataset in datasaurus_dozen.

Click for answer

```
ggplot(data = datasaurus_dozen, aes(x = dataset, y = x)) +
  geom_boxplot() +
  theme(axis.text.x = element_text(angle = 45, hjust = 1))
```

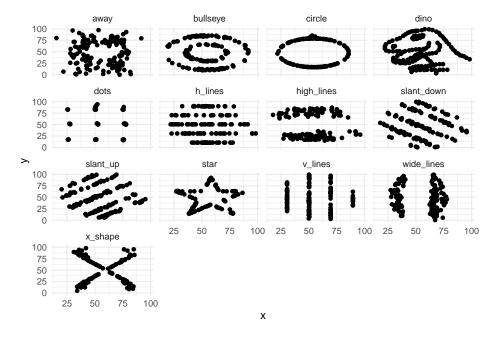

10.1.5 Faceting

Click for answer

Answer:

a. Create a scatterplot of x vs. y for each dataset in datasaurus_dozen using facet_wrap().

```
ggplot(data = datasaurus_dozen, aes(x = x, y = y)) +
  geom_point() +
  facet_wrap(~ dataset) +
  theme_minimal()
```

10.1.6 Variable Transformation

a. The scatterplot of the dino dataset without any transformations is given below.

Click for answer

Answer:

```
ggplot(data = dino_data, aes(x = x, y = y)) +
  geom_point() +
  theme_minimal() -> p1
```

b. Now, apply the square root transformation to both the x and y axes using the scale_x_sqrt() and scale_y_sqrt() functions in the dino dataset.

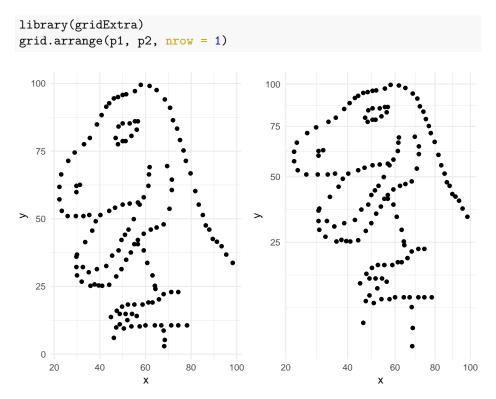

Click for answer

```
ggplot(data = dino_data, aes(x = x, y = y)) +
geom_point() +
scale_x_sqrt() +
scale_y_sqrt() +
theme_minimal() -> p2
```

c. Finally, use grid.arrange() function from gridExtra package to plot the above two plots side-by-side. Which plot do you prefer and why?

Click for answer

Answer: The second plot is more revealing of a dinosaur than the first plot.

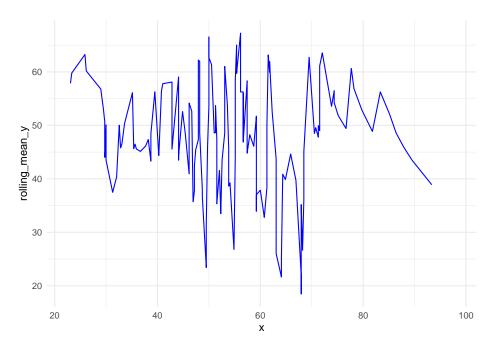

10.1.7 (Optional) Lne plot

a. Create a line plot of the x variable over the y variable for the dino dataset. To make it more interesting, let's first calculate the rolling mean of the y variable.

Click for answer

```
dino_data <- dino_data %>%
  arrange(x) %>%
  mutate(rolling_mean_y = zoo::rollmean(y, k = 5, fill = NA))
```

```
# Line plot
ggplot(data = dino_data, aes(x = x, y = rolling_mean_y)) +
  geom_line(color = "blue") +
  theme_minimal()
```

Chapter 11

Class Activity 5

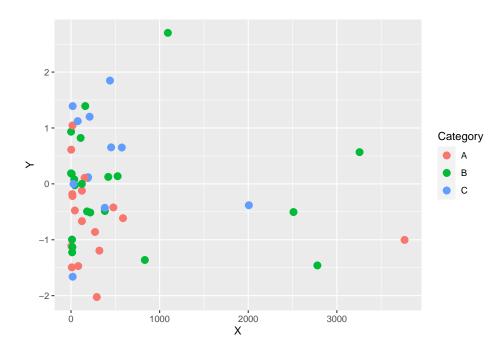

```
# Load the required libraries
library(tidyverse)
library(ggplot2)
library(ggthemes)
```

11.1 Problem 1: Changing color and shape scales

In this problem, you will learn about the effects of changing colors, scales, and shapes in ggplot2 for both gradient and discrete color choices. You will be given a series of questions and examples to enhance your understanding. Consider the following scatter plot

```
# Generate sample data
set.seed(42)
data <- data.frame(
   Category = factor(sample(1:3, 50, replace = TRUE), labels = c("A", "B", "C")),
   X = 10 ^ rnorm(50, mean = 2, sd = 1),
   Y = rnorm(50, mean = 0, sd = 1)
)

p <- ggplot(data, aes(x = X, y = Y, color = Category)) +
   geom_point(size = 3)
p</pre>
```

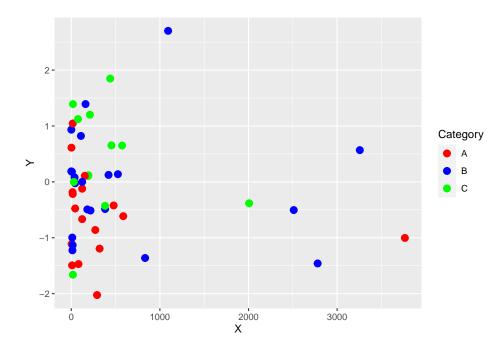

a. Modify the scatter plot to use custom colors for each category using scale_color_manual(). What is the effect of changing the colors on the plot's readability?

Click for answer

Answer: Changing colors using scale_color_manual() allows for better distinction between categories and enhances the plot's readability.

```
p <- ggplot(data, aes(x = X, y = Y, color = Category)) +
  geom_point(size = 3) +
  scale_color_manual(values = c("A" = "red", "B" = "blue", "C" = "green"))
p</pre>
```

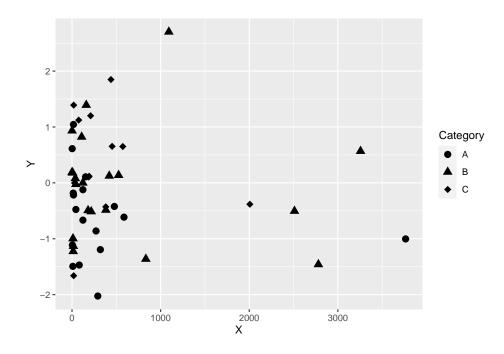

b. Modify the scatter plot to use custom shapes for each category using scale_shape_manual(). What is the effect of changing the shapes on the plot's readability?

Click for answer

Answer: Changing the shapes using scale_shape_manual() helps to distinguish between categories and improves the plot's readability

```
p <- ggplot(data, aes(x = X, y = Y, shape = Category)) +
   geom_point(size = 3) +
   scale_shape_manual(values = c("A" = 16, "B" = 17, "C" = 18))
p</pre>
```

11.2 Problem 2: US maps

Now, let's learn about the effect of changing various coordinate systems in ggplot2 using a map example from the usmap package. We will explore the different types of coordinate systems available in ggplot2 and how they can be applied to the map visualization.

```
#install.packages("usmap") #uncomment to install
library(usmap)
```

11.2.1 a. Plot a simple map of the United States using ggplot2 and the usmap package.

Click for answer

```
us <- plot_usmap()
us</pre>
```

11.2.2 b. Apply the coord_flip() function to the map to flip the x and y axes.

Click for answer

```
us_flipped <- us + coord_flip()
us_flipped</pre>
```

11.2.3 c. Apply the coord_polar() function to the map to transform the plot to a polar coordinate system

Click for answer

```
us_polar <- us + coord_polar()
us_polar</pre>
```

11.2.4 d. Apply the coord_quickmap() function to the map to provide an approximation for a map projection.

Click for answer

```
us_quickmap <- us + coord_quickmap()
us_quickmap</pre>
```

11.3 Problem 3: Chloropeth map

In today's class we created cloropleth maps of states in the US based on ACS data.

```
states <- map_data("state")
ACS <- ACS <- read.csv("https://raw.githubusercontent.com/deepbas/statdatasets/main/ACACS <- dplyr::filter(ACS, !(region %in% c("Alaska", "Hawaii"))) # only 48+D.C.
ACS$region <- tolower(ACS$region) # lower case (match states regions)</pre>
```

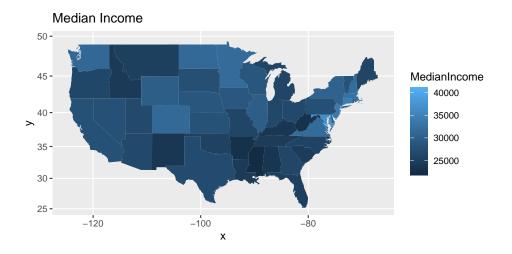

11.3.1 (a) Mapping median income

Create a ${\tt cloropleth}$ plot that uses color to create a ${\tt MedianIncome}$ map of the US.

Click for answer

```
# map median income
ggplot(data=ACS) + coord_map() +
```

```
geom_map(aes(map_id = region, fill = MedianIncome), map = states) +
expand_limits(x=states$long, y=states$lat) + ggtitle("Median Income")
```

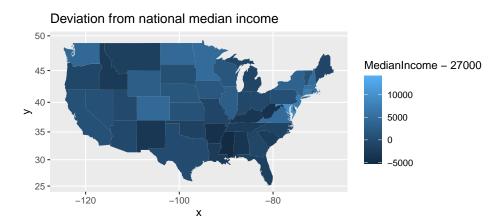

11.3.2 (b) Mapping deviations from national median income

The median income in the US in 2016 was estimated to be \$27,000. Redraw your map in (a) to visualize each state's deviation from national median income.

Click for answer

```
# compare state income to national income
ggplot(data=ACS) + coord_map() +
  geom_map(aes(map_id = region, fill = MedianIncome - 27000), map = states) +
  expand_limits(x=states$long, y=states$lat) + ggtitle("Deviation from national median income")
```

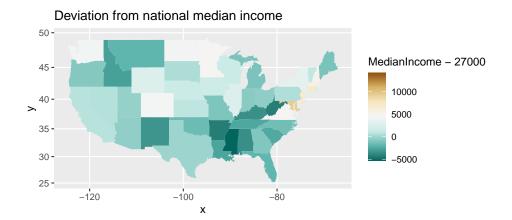

11.3.3 (c) Changing numerically scaled color

You should use a *diverging* color for (b) to highlight larger deviations from the national median. Add scale_fill_distiller to the map from (b) and select a diverging palette.

Click for answer

```
# change to a diverging color
ggplot(data=ACS) + coord_map() +
  geom_map(aes(map_id = region, fill = MedianIncome - 27000), map = states) +
  expand_limits(x=states$long, y=states$lat) + ggtitle("Deviation from national median
  scale_fill_distiller(type = "div")
```

11.3.4 (d) Fixing a midpoint on a diverging scale

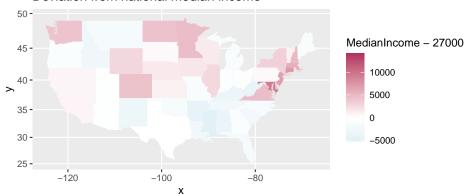

Use scale_fill_gradient2 to fix a midpoint scale value at white color, with diverging colors for larger positive and negative values. Apply these colors to your map in (b) and fix the midpoint at an appropriate value.

Click for answer

Answer:

```
# change to a gradient fill color
ggplot(data=ACS) + coord_map() +
geom_map(aes(map_id = region, fill = MedianIncome - 27000), map = states) +
expand_limits(x=states$long, y=states$lat) + ggtitle("Deviation from national median income") +
scale_fill_gradient2(
   low = "lightblue",  # Set the low color to red
   mid = "white", # Set the mid color to yellow
   high = "marcoon", # Set the high color to green
   midpoint = 0
)
```

Deviation from national median income

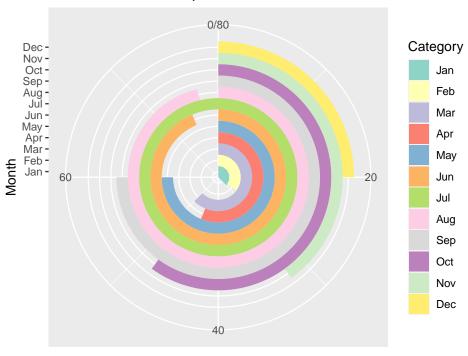

11.4 (Optional)

Let's learn how to create a polar bar plot with custom colors.

```
data <- data.frame(
   Category = factor(1:12, labels = month.abb),
   Value = c(30, 28, 50, 45, 60, 75, 80, 77, 60, 48, 32, 20)
)</pre>
```

```
p <- ggplot(data, aes(x = Category, y = Value, fill = Category)) +
    geom_bar(stat = "identity", width = 1) +
    coord_polar(theta = "y") +
    scale_fill_brewer(palette = "Set3") +
    labs(title = "Polar Bar Plot Example", x = "Month", y = "Value")
p</pre>
```

Polar Bar Plot Example

Value

Chapter 12

Class Activity 6

```
# load the necessary libraries
library(dplyr)
library(ggplot2)
library(babynames)
```

We will work with the babynames dataset again in this class activity. The header of the dataset looks like this:

knitr::kable(head(babynames))

year	sex	name	n	prop
1880	F	Mary	7065	0.0723836
1880	F	Anna	2604	0.0266790
1880	F	Emma	2003	0.0205215
1880	F	Elizabeth	1939	0.0198658
1880	F	Minnie	1746	0.0178884
1880	F	Margaret	1578	0.0161672

In this tutorial, we will learn about the five main verbs of dplyr and how to use them to manipulate data:

- select(): Choose columns from a data frame
- filter(): Choose rows based on a condition
- arrange(): Sort the rows of a data frame
- mutate(): Add new columns based on existing columns
- summarise(): Aggregate data and compute summary statistics

12.1 Problem 1: select()

Which of these is NOT a way to select the name and n columns together?

```
select(babynames, -c(year, sex, prop)) #1
select(babynames, name:n) #2
select(babynames, starts_with("n")) #3
select(babynames, ends_with("n")) #4
```

Click for answer

Answer: 4 is not the way to select the name and n columns together

12.2 Problem 2: filter()

Use filter() with the logical operators to extract:

12.2.1 a. All of the names where prop is greater than or equal to 0.08

```
filter(babynames, prop >= 0.08)
# A tibble: 3 x 5
  year sex name
                    n prop
 <dbl> <chr> <chr> <int> <dbl>
1 1880 M John
                   9655 0.0815
2 1880 M
          William 9532 0.0805
3 1881 M
            John 8769 0.0810
# alternate
babynames %>% filter(prop >= 0.08)
# A tibble: 3 x 5
  year sex name
                          prop
                      n
  <dbl> <chr> <chr> <int> <dbl>
1 1880 M John 9655 0.0815
2 1880 M William 9532 0.0805
3 1881 M John 8769 0.0810
```

12.2.2 b. All of the babies named "Rose"

Click for answer

```
babynames %>% filter(name == "Rose")
# A tibble: 247 x 5
   year sex
             name
                      n
                            prop
  <dbl> <chr> <chr> <int>
                            <dbl>
             Rose 700 0.00717
 1 1880 F
2 1880 M
                    7 0.0000591
             Rose
3 1881 F
           Rose 734 0.00743
             Rose 886 0.00766
4 1882 F
5 1883 F
           Rose 877 0.00730
6 1883 M
           Rose 5 0.0000445
7 1884 F
             Rose 1060 0.00770
8 1884 M
             Rose
                   5 0.0000407
9 1885 F
             Rose 1164 0.00820
10 1885 M
                      9 0.0000776
             Rose
# ... with 237 more rows
```

12.2.3 c. Use filter() to choose all rows where name is "John" and sex is "M".

```
babynames %>% filter(name == "John", sex == "M")
```

```
# A tibble: 138 x 5
   year sex
             name
                      n prop
  <dbl> <chr> <chr> <int> <dbl>
 1 1880 M
             John 9655 0.0815
2 1881 M
             John 8769 0.0810
3 1882 M
             John 9557 0.0783
4 1883 M
             John 8894 0.0791
5 1884 M
             John 9388 0.0765
6 1885 M
             John 8756 0.0755
7 1886 M
             John 9026 0.0758
             John 8110 0.0742
8 1887 M
9 1888 M
             John 9247 0.0712
10 1889 M
             John 8548 0.0718
# ... with 128 more rows
```

12.3 Problem 3: arrange()

12.3.1 a. Use arrange() to sort the babynames dataset by the prop column in descending order.

Click for answer

```
babynames %>% arrange(desc(prop))
```

```
# A tibble: 1,924,665 x 5
   year sex name
                      n
                         prop
  <dbl> <chr> <chr> <int> <dbl>
1 1880 M
            John 9655 0.0815
2 1881 M
           John
                   8769 0.0810
3 1880 M William 9532 0.0805
4 1883 M
           John 8894 0.0791
         William 8524 0.0787
5 1881 M
6 1882 M John 9557 0.0783
7 1884 M
           John 9388 0.0765
8 1882 M
            William 9298 0.0762
9 1886 M
            John
                    9026 0.0758
10 1885 M
            John
                    8756 0.0755
# ... with 1,924,655 more rows
```

12.3.2 b. Use arrange() to sort the babynames dataset by year (ascending) and then by prop (descending).

Click for answer

babynames %>% arrange(year, desc(prop))

```
# A tibble: 1,924,665 x 5
   year sex name n
                        prop
  <dbl> <chr> <chr> <int> <dbl>
1 1880 M John 9655 0.0815
2 1880 M
          William 9532 0.0805
         Mary
3 1880 F
                   7065 0.0724
4 1880 M
          James
                   5927 0.0501
5 1880 M
           Charles 5348 0.0452
6 1880 M
            George 5126 0.0433
7 1880 M
         Frank
                   3242 0.0274
8 1880 F
            Anna
                  2604 0.0267
9 1880 M
           Joseph 2632 0.0222
```

```
10 1880 M Thomas 2534 0.0214 # ... with 1,924,655 more rows
```

12.4 Problem 4: mutate()

12.4.1 a. Use mutate() to create a new column called decade which contains the decade the record is in (e.g., 1990 for the years 1990-1999).

Click for answer

```
babynames %>% mutate(decade = (year %/% 10) * 10)
```

```
# A tibble: 1,924,665 x 6
   year sex
              name

12.5 Problem 5: summarize() or summarise()

Use the codes mentioned so far to compute three statistics:

- the total number of children who ever had your name
- the maximum number of children given your name in a single year
- the mean number of children given your name per year/decade (optional)

```
babynames %>%
filter(name == "Dee", sex == "M")
```

```
# A tibble: 136 x 5
   year sex name

12.6 Problem 6

12.6.1 a. Use min_rank() and mutate() to rank each row in babynames from largest prop to smallest prop.

Click for answer

```
babynames %>% mutate(rank = min_rank(desc(prop))) %>% arrange(rank)
```

12.6.2 b. Compute each name's rank within its year and sex.

```

polluted_cities %>% select_if(is.numeric) #1
polluted_cities %>% rename_all(toupper) #2
polluted_cities %>% rename_if(is.character, toupper) #3
polluted_cities %>% rename_at(vars(contains("it")), toupper) #4
```

Click for answer

answer:

- 1. Selects all numeric columns from the polluted_cities dataset.
- 2. Renames all column names in the polluted_cities dataset to uppercase.
- 3. Renames column names with character data type in the polluted_cities dataset to uppercase.
- 4. Renames column names containing "it" in the polluted_cities dataset to uppercase.

```
polluted_cities %>% select_if(is.numeric) #1
# A tibble: 6 x 1

```

Let's look at an interesting example on how to join related information on various artists, bands, songs, and their labels.

```
"Lennon", "McCartney", "Page", "Perry", "Presley",
                           "Richards", "Simon", "Starr", "Walsh", "Wilson", "Wilson"),
                  instrument = c("Guitar", "Guitar", "Vocals", "Vocals", "Vocals",
                                  "Guitar", "Bass", "Guitar", "Guitar", "Vocals", "Guit
                                 "Guitar", "Drums", "Guitar", "Vocals", "Vocals"))
bands <- tibble(first = c("John", "John Paul", "Jimmy", "Robert", "George", "John",
                          "Paul", "Ringo", "Jimmy", "Mick", "Keith", "Charlie", "Ronnie"
                last = c("Bonham", "Jones", "Page", "Plant", "Harrison", "Lennon",
                         "McCartney", "Starr", "Buffett", "Jagger", "Richards", "Watts
                band = c("Led Zeppelin", "Led Zeppelin", "Led Zeppelin", "Led Zeppelin"
                         "The Beatles", "The Beatles", "The Beatles", "The Beatles",
                         "The Coral Reefers", "The Rolling Stones", "The Rolling Stone
                         "The Rolling Stones", "The Rolling Stones"))
albums <- tibble(album = c("A Hard Day's Night", "Magical Mystery Tour", "Beggar's Band
                           "Abbey Road", "Led Zeppelin IV", "The Dark Side of the Moon
                           "Rumours", "Hotel California"),
                 band = c("The Beatles", "The Beatles", "The Rolling Stones", "The Beatles",
                          "Led Zeppelin", "Pink Floyd", "Aerosmith", "Fleetwood Mac",
                 year = c(1964, 1967, 1968, 1969, 1971, 1973, 1973, 1977, 1982))
songs <- tibble(song = c("Come Together", "Dream On", "Hello, Goodbye", "It's Not Unus
                album = c("Abbey Road", "Aerosmith", "Magical Mystery Tour", "Along Company")
                first = c("John", "Steven", "Paul", "Tom"),
                last = c("Lennon", "Tyler", "McCartney", "Jones"))
labels <- tibble(album = c("Abbey Road", "A Hard Days Night", "Magical Mystery Tour",
                           "Led Zeppelin IV", "The Dark Side of the Moon", "Hotel Cali:
                           "Rumours", "Aerosmith", "Beggar's Banquet"),
                 label = c("Apple", "Parlophone", "Parlophone", "Atlantic", "Harvest",
                           "Asylum", "Warner Brothers", "Columbia", "Decca"))
```

Let's take a glimpse of the tibbles artists and bands. Notice that there are different number of rows in the dataset.

```
glimpse(artists)
```

```

```

13.2 Problem 2: Joining artists and bands data

13.2.1 a. Join the artists and bands tibbles using left_join(), right_join(), and full_join(). Verify that the datasets obtained from left_join() and right_join() are the same using setequal().

```
bands2 <- left_join(bands, artists, by = c("first", "last"))
bands3 <- right_join(artists, bands, by = c("first", "last"))
full_bands <- full_join(artists, bands, by = c("first", "last"))
# Check if the datasets are the same
setequal(bands2, bands3)</pre>
```

[1] TRUE

13.2.2 b. Use the pipe operator, %>%, to create one table that combines all information from artists, bands, albums, songs, and labels.

```
all_info <- artists %>%
  full_join(bands, by = c("first", "last")) %>%
  full_join(songs, by = c("first", "last")) %>%
  full_join(albums, by = c("album", "band")) %>%
  full_join(labels, by = c("album"))
all_info
```

```

12	d	F	3	118	38	74

14.1.5 e. Calculate the mean SBP and DBP for each visit and save the result as mean_BP_by_visit.

Click for answer

Answer:

14.2 Your turn 2

14.2.1 a. Parsing Complex Dates: Use dmy_hms() to parse the following date-time string: "25-Dec-2020 17:30:00"

Click for answer

```
parsed_date <- dmy_hms("25-Dec-2020 17:30:00")
parsed_date</pre>
```

- [1] "2020-12-25 17:30:00 UTC"
- 14.2.2 b. Advanced Date Arithmetic: Calculate the exact age in years for someone born on "1995-05-15 09:30:00".

Click for answer

Answer:

```
dob <- ymd_hms("1995-05-15 09:30:00")
exact_age <- as.duration(interval(dob, now())) / dyears(1)
exact_age</pre>
```

- [1] 27.95297
- 14.2.3 c. Creating Date-Time Objects: Create a date-time object for March 15, 2020, 13:30:00 using make_datetime().

Click for answer

Answer:

```
new_date_time <- make_datetime(2020, 3, 15, 13, 30, 0)
new_date_time</pre>
```

- [1] "2020-03-15 13:30:00 UTC"
- 14.2.4 d. Extracting Components from Date-Time Objects: Extract the year, month (as a number), day, hour, and minute from "2022-07-01 14:45:00".

Click for answer

```
example_date_time <- ymd_hms("2022-07-01 14:45:00")
extracted_components <- tibble(</pre>
 year = year(example_date_time),
 month = month(example_date_time),
 day = day(example_date_time),
 hour = hour(example_date_time),
 minute = minute(example_date_time)
)
extracted_components
# A tibble: 1 x 5
  year month day hour minute
  <dbl> <dbl> <int> <int> <int>
1 2022
        7
               1
                    14
```

14.2.5 e. Advanced Date-Time Arithmetic with Periods: Add 2 months and 15 days to "2021-08-01".

Click for answer

Answer:

```
initial_date <- ymd("2021-08-01")
new_date <- initial_date + months(2) + days(15)
new_date</pre>
```

[1] "2021-10-16"

14.2.6 f. Duration and Time Differences: Calculate the duration in days, weeks, months, and years between "2019-04-01" and "2022-04-01".

Click for answer

```
start_date <- ymd("2019-04-01")
end_date <- ymd("2022-04-01")
time_diff <- end_date - start_date
duration_days <- as.duration(time_diff)
duration_weeks <- duration_days / dweeks(1)
duration_months <- duration_days / dmonths(1)
duration_years <- duration_days / dyears(1)</pre>
```

```
duration_results <- tibble(
   days = duration_days,
   weeks = duration_weeks,
   months = duration_months,
   years = duration_years
)
duration_results</pre>
```

Chapter 15

Class Activity 9

```
# load the necessary libraries
library(tidyverse)
```

15.1 Your Turn 1

15.1.1 a) read_csv()

Use read_csv() to import the desserts data set from https://raw.githubusercontent.com/deepbas/statdatasets/main/desserts.csv. Use glimpse to see if the data import is alright.

```
url <- "https://raw.githubusercontent.com/deepbas/statdatasets/main/desserts.csv"
desserts <- read_csv(url)
glimpse(desserts)</pre>
```

```
Rows: 549
Columns: 16
$ series
                        <dbl> 1, 1, 1, 1, 1, 1, 1, 1, 1, 1~
$ episode
                        <dbl> 1, 1, 1, 1, 1, 1, 1, 1, 1, 1~
$ baker
                        <chr> "Annetha", "David", "Edd", "~
                        <chr> "2nd", "3rd", "1st", "N/A", ~
$ technical
                        <chr> "IN", "IN", "IN", "IN", "IN"~
$ result
                        <chr> "17 August 2010", "17 August~
$ uk_airdate
$ us_season
                        <dbl> NA, NA, NA, NA, NA, NA, NA, ~
$ us airdate
                        <date> NA, NA, NA, NA, NA, NA, NA, ~
\ showstopper_chocolate <chr> "chocolate", "chocolate", "n~
```

15.1.2 b) Are there any issues with the data import? If so, what are they?

Click for answer

Answer: Based on the output of glimpse, we can see that the 'technical' column should be a numeric column and the 'uk_airdate' column should be a date column. We can also identify any issues with missing values.

```
# your r-code

desserts <- read_csv(url,
    col_types = list(
    technical = col_number(),
    uk_airdate = col_date()
)

problems(desserts)</pre>
```

```
# A tibble: 556 x 5
          col expected
                                               file
                                actual
   <int> <int> <chr>

15.2 Your Turn 2

Use the appropriate read_<type>() function to import the following data sets:

• https://deepbas.io/data/simple-1.dat

expected <chr>, actual <chr>, file <chr>

- https://deepbas.io/data/mild-1.csv
- https://deepbas.io/data/tricky-1.csv
- https://deepbas.io/data/tricky-2.csv

Identify and fix any issues you encounter.

15.2.1 a) Importing simple data:

```
simple1 <- readr::read_csv("https://deepbas.io/data/simple-1.dat")
problems(simple1)

# A tibble: 0 x 5
# ... with 5 variables: row <int>, col <int>,
# expected <chr>, actual <chr>, file <chr>
```

15.2.2 b) Importing mildly tricky data:

```
Click for answer
```

```
mild1 <- readr::read_delim("https://deepbas.io/data/mild-1.csv", delim = "|")</pre>
problems(mild1)
# A tibble: 0 x 5
# ... with 5 variables: row <int>, col <int>,
# expected <chr>, actual <chr>, file <chr>
15.2.3 c) Importing tricky data 1:
Click for answer
tricky1 <- read_csv("https://deepbas.io/data/tricky-1.csv")</pre>
problems(tricky1)
# A tibble: 2 x 5
   row col expected actual
                                 file
 <int> <int> <chr>
                                 <chr>
   4 4 5 columns 4 columns ""
           4 5 columns 4 columns ""
# Fix missing values
tricky1[3, ] <- c(tricky1[3, 1:2], NA, tricky1[3, 3:4])</pre>
```

15.2.4 d) Importing tricky data 2:

tricky1[6,] <- c(tricky1[4, 1], NA, tricky1[4, 3:5])</pre>

```
tricky2 <- read_csv("https://deepbas.io/data/tricky-2.csv")
problems(tricky2)

# A tibble: 0 x 5
# ... with 5 variables: row <int>, col <int>,
# expected <chr>, actual <chr>, file <chr>
```

```
# Fix missing values
tricky2_part1 <- read_csv("https://deepbas.io/data/tricky-2.csv", n_max = 7) %>%
    separate(city, c("city", "state"), sep = ",") %>%
    select(-c(7))

tricky2_part2 <- read_csv(
    "https://deepbas.io/data/tricky-2.csv",
    skip = 8,
    col_names = c("iata", "airport", "city", "state", "latitude", "longitude")
)
# Combine parts
data_combined <- full_join(tricky2_part1, tricky2_part2)</pre>
```

Chapter 16

Class Activity 10

```
# load the necessary libraries
library(tidyverse)
library(tidyr)
```

16.1 Your Turn 1

```
students <- tibble(
  id = 1:24,
    grade = sample(c("9th", "10th", "11th"), 24, replace = TRUE),
    region = sample(c("North America", "Europe", "Asia", "South America", "Middle East", "Africa");
    score = round(runif(24,50, 100))
)</pre>
```

16.1.1 a. Create a new column grade_fac by converting the grade column into a factor. Reorder the levels of grade_fac to be "9th", "10th", and "11th". Sort the dataset based on the grade_fac column.

Click for answer

```
students_a <- students %>%
mutate(grade_fac = factor(grade)) %>%
```

```
mutate(grade_fac = fct_relevel(grade_fac, c("9th", "10th", "11th"))) %>%
arrange(grade_fac)
print(students_a, n = 24)
```

```
# A tibble: 24 x 5
     id grade region
                         score grade_fac
  <int> <chr> <chr>
                        <dbl> <fct>
     1 9th Europe
                            80 9th
1
     2 9th North America
2
                            76 9th
3
     4 9th Africa
                            59 9th
     7 9th Asia
                            62 9th
5
     8 9th South America
                           79 9th

24
     21 11th Middle East
```

16.1.2 b. Create a new column region_fac by converting the region column into a factor. Collapse the region_fac levels into three categories: "Americas", "EMEA" and "Asia". Count the number of students in each collapsed region category.

Click for answer

16.1.3 c. Create a new column grade_infreq that is a copy of the grade_fac column. Reorder the levels of grade_infreq based on their frequency in the dataset. Print the levels of grade_infreq to check the ordering.

7 7

Click for answer

Answer:

2 Asia

3 Americas

```
students_c <- students_a %>%
  mutate(grade_infreq = grade_fac) %>%
  mutate(grade_infreq = fct_infreq(grade_infreq))
levels(students_c$grade_infreq)
```

[1] "9th" "10th" "11th"

d. Create a new column grade_lumped by lumping the least frequent level of the grade_fac column into an 'Others' category. Count the number of students in each of the categories of the grade_lumped column.

Click for answer

16.2 Your Turn 2

Lets import the gss_cat dataset from the forcats library. This datast contains a sample of categorical variables from the General Social survey.

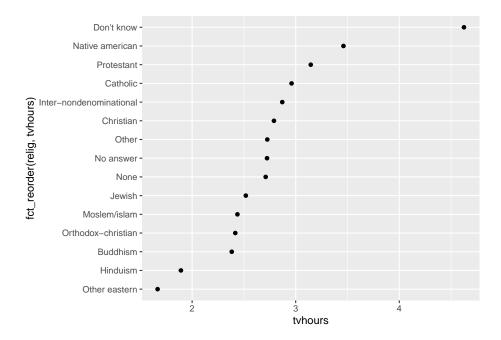

```
# import gss_cat dataset from forcats library
forcats::gss cat
# A tibble: 21,483 x 9
   year marital age race rincome partyid relig denom
                  <int> <fct> <fct>
  <int> <fct>
                                     <fct>
                                            <fct> <fct>
1 2000 Never marr~ 26 White $8000 ~ Ind,ne~ Prot~ Sout~
2 2000 Divorced
                    48 White $8000 ~ Not st~ Prot~ Bapt~
3 2000 Widowed
                    67 White Not ap~ Indepe~ Prot~ No d~
   2000 Never marr~ 39 White Not ap~ Ind,ne~ Orth~ Not ~
   2000 Divorced
5
                     25 White Not ap~ Not st~ None Not ~
  2000 Married
                     25 White $20000~ Strong~ Prot~ Sout~
7
   2000 Never marr~ 36 White $25000~ Not st~ Chri~ Not ~
   2000 Divorced
                      44 White $7000 ~ Ind, ne~ Prot~ Luth~
9 2000 Married
                      44 White $25000~ Not st~ Prot~ Other
10 2000 Married
                      47 White $25000~ Strong~ Prot~ Sout~
# ... with 21,473 more rows, and 1 more variable:
   tvhours <int>
```

Use gss_cat to answer the following questions.

16.2.1 a. Which religions watch the least TV?

Click for answer

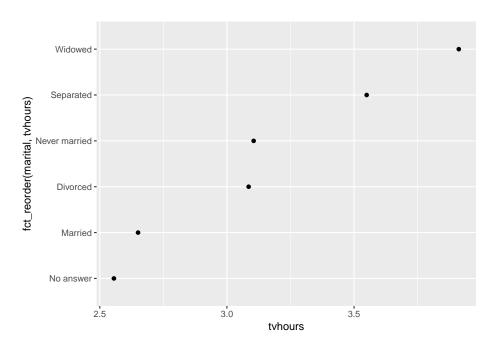

```
# your r-code
gss_cat %>%
  drop_na(tvhours) %>%
  group_by(relig) %>%
  summarize(tvhours = mean(tvhours)) %>%
  ggplot(aes(tvhours, fct_reorder(relig, tvhours))) +
     geom_point()
```

16.2.2 b. Do married people watch more or less TV than single people?

Click for answer

```
# your r-code
gss_cat %>%
  drop_na(tvhours) %>%
  group_by(marital) %>%
  summarize(tvhours = mean(tvhours)) %>%
  ggplot(aes(tvhours, fct_reorder(marital, tvhours))) +
    geom_point()
```

16.2.3 c. Collapse the marital variable to have levels married, not_married, and no_answer. Include "Never married", "Divorced", and "Widowed" in not_married

Click for answer

levels(marital_c\$maritalStatus)

[1] "no_answer" "not_married" "married"

Chapter 17

Class Activity 11

```
# load the necessary libraries
library(tidyverse)
library(stringr)
```

17.1 Problem 1

Let's learn about combining strings with different separators first.

```
place <- "Central Park"
activity <- "jogging"
activities <- c("jogging", "picnicking", "boating")
my_sentence <- str_c(place, " is great for ", activity, ".", sep = "")
my_sentence</pre>
```

- [1] "Central Park is great for jogging."
 - a. What happens when a str_c entry is a vector?

Click for answer

Answer: When an entry in str_c is a vector, it will combine the strings with each element of the vector, creating multiple combined strings.

```
my_sentences <- str_c(place, " is great for ", activities, ".", sep = "")
my_sentences</pre>
```

- [1] "Central Park is great for jogging."
- [2] "Central Park is great for picnicking."
- [3] "Central Park is great for boating."
 - b. How do you combine strings with str_glue?

Click for answer

Answer: You can combine strings with str_glue using curly braces {} to insert variables directly into the string.

```
my_sentence <- str_glue("{place} is great for {activity}.")
my_sentence</pre>
```

Central Park is great for jogging.

```
my_sentences1 <- str_glue("{place} is great for {activities}.")
my_sentences1</pre>
```

```
Central Park is great for jogging.
Central Park is great for picnicking.
Central Park is great for boating.
```

c. What does str_flatten do?

Click for answer

Answer: str_flatten collapses a character vector into a single string by concatenating the elements with a specified separator.

```
str_flatten(my_sentences, collapse = " and ")
```

- [1] "Central Park is great for jogging. and Central Park is great for picnicking. and
 - d. What will using a \n separator do in the command below?

Click for answer

Answer: Using a \n separator in the command will insert a newline character between the strings being combined, making them display on separate lines when printed.

```
p <- str_c(place, " is great for ", activity, sep = "\n")
writeLines(p)</pre>
```

Central Park is great for jogging

e. Does str_length count spaces and special characters??

Click for answer

Answer: Yes, str_length counts spaces and special characters as part of the string's length.

p

[1] "Central Park\n is great for \njogging"

```
str_length(p)
```

[1] 35

f. How do you count the number of e's in a string?

Click for answer

Answer: You can count the number of e's in a string using str_count with a pattern that matches the character 'e'.

```
text <- "The quick brown fox jumps over the lazy dog."
pattern <- "e"
vowel_count <- str_count(text, pattern)
vowel_count</pre>
```

[1] 3

g. What happens with negative positions?

Click for answer

Answer: Negative positions in str_sub count the positions from the end of the string rather than from the beginning.

```
str_sub(my_sentence, start = -3, end = -1)
```

[1] "ng."

h. How do you extract a substring with positive and negative positions?

Click for answer

Answer: You can extract a substring with positive and negative positions using str_sub and specifying the start and end positions with either positive or negative numbers.

```
my_sentence <- "Central Park is great for jogging."
positive_substr <- str_sub(my_sentence, start = 1, end = 12)
negative_substr <- str_sub(my_sentence, start = -8, end = -1)
positive_substr</pre>
```

[1] "Central Park"

```
negative_substr
```

[1] "jogging."

i. With a vector of positions?

Click for answer

Answer: Using a vector of positions with str_sub will extract substrings starting and ending at the specified positions in the vector.

```
str_sub(my_sentence, start = c(1, 9), end = c(4, 15))
```

[1] "Cent" "Park is"

j. How do you extract multiple substrings using a vector of positions?

Click for answer

Answer: You can extract multiple substrings using a vector of positions with str_sub by specifying the start and end positions in separate vectors.

```
my_sentence <- "Central Park is great for jogging."
substrs <- str_sub(my_sentence, start = c(1, 14, 24), end = c(12, 19, 30))
substrs

[1] "Central Park" "is gre" "or jogg"</pre>
```

17.2 Problem 2

a. Use the string parsing functions that you learned today to do tasks described in the comments below:

```
s1 <- "12%" # remove %
s2 <- "New Jersey_*" # remove _*
s3 <- "2,150" # remove comma(,)
s4 <- "Learning #datascience is fun!" # extract #datascience
s5 <- "123 Main St, Springfield, MA, 01101" # separate info</pre>
```

Click for answer

```
# Cleaning steps
s1_clean <- str_replace(s1, "%", "")
s2_clean <- str_replace(s2, "_\\*", "")
s3_clean <- str_replace(s3, ",", "")
s4_clean <- str_extract(s4, "#\\w+")
s5_clean <- str_split(s5, ",\\s?")

# Print cleaned strings
s1_clean

[1] "12"
s2_clean

[1] "New Jersey"
s3_clean</pre>
```

[1] "2150"

```
s4_clean

[1] "#datascience"

s5_clean

[[1]]
[1] "123 Main St" "Springfield" "MA" "01101"
```

17.3 Problem 3

a. Use the string parsing functions that you learned today to do tasks described in the comments below:

```
s1 <- "25%" # remove %
s2 <- "Los Angeles_#" # remove _#
s3 <- "1,250" # remove comma(,)
s4 <- "Discover #machinelearning today!" # extract #machinelearning
s5 <- "456 Main St, San Francisco, CA, 94107" # separate info</pre>
```

Click for answer

[1] "1250"

```
# Cleaning steps
s1_clean <- str_replace(s1, "%", "")
s2_clean <- str_replace(s2, "_#", "")
s3_clean <- str_replace(s3, ",", "")
s4_clean <- str_extract(s4, "#\\w+")
s5_clean <- str_split(s5, ",\\s?")

# Print cleaned strings
s1_clean

[1] "25"
s2_clean

[1] "Los Angeles"
s3_clean</pre>
```

```
s4_clean

[1] "#machinelearning"

s5_clean

[[1]]
[1] "456 Main St" "San Francisco" "CA"
[4] "94107"
```

17.4 Problem 4

a. Let's look at the following dataset containing information about movies and their release years. We'll extract the release year from the movie title, create a new column with decades, and count the number of movies in each decade.

```
# Sample dataset
movies <- tibble(
 title = c(
    "The Godfather (1972)", "Pulp Fiction (1994)", "The Dark Knight (2008)",
    "Forrest Gump (1994)", "The Shawshank Redemption (1994)", "The Matrix (1999)",
    "Inception (2010)", "Interstellar (2014)", "Parasite (2019)", "Fight Club (1999)"
  )
)
movies
# A tibble: 10 \times 1
   title
   <chr>>
 1 The Godfather (1972)
 2 Pulp Fiction (1994)
 3 The Dark Knight (2008)
 4 Forrest Gump (1994)
 5 The Shawshank Redemption (1994)
 6 The Matrix (1999)
 7 Inception (2010)
8 Interstellar (2014)
 9 Parasite (2019)
10 Fight Club (1999)
```

```
# Processing the dataset
movies_processed <- movies %>%
  mutate(
    release_year = as.integer(str_extract(title, "\\d{4}\")),
    decade = floor(release_year / 10) * 10
) %>%
  count(decade) %>%
  rename(num_movies = n)

# Print the processed dataset
movies_processed
```

Chapter 18

Class Activity 12

In-class midterm!

Chapter 19

Class Activity 13

```
# load the necessary libraries
library(stringr)
library(dplyr)
library(readr)
```

In this tutorial, we will learn about string manipulations using regular expressions and the **stringr** library in R. We will cover different examples and use cases to help you understand the concepts and functions related to string manipulation.

19.1 Group Activity 1

```
x <- "My SSN is 593-29-9502 and my age is 55"
y <- "My phone number is 612-643-1539"
z <- "My old SSN number is 39532 9423."
out <- str_flatten(c(x,y,z), collapse = ". ")</pre>
```

19.1.1 a. What characters in x will str_view_all(x, "-..-") find?

Click for answer

answer:

The pattern searches for a dash, followed by any two characters, followed by another dash. In x, it finds "-29-" which is a part of the SSN.

```
str_view_all(x, "-..-")
```

[1] | My SSN is 593 < -29 > 9502 and my age is 55

19.1.2 b. What pattern will str_view_all(x, "-\\d{2}-") find?

Click for answer

answer:

The pattern searches for a dash, followed by two digits, followed by another dash. In x, it finds the same "-29-" as in the previous example, which is a part of the SSN.

```
str\_view\_all(x, "-\d{2}-") # "-" then 2 digits then "-"
```

[1] | My SSN is 593<-29->9502 and my age is 55

19.1.3 c. What pattern will str_view_all(out, "\\d{2}\\.*") find?

Click for answer

answer:

The pattern searches for two digits followed by an optional period. In out, it finds "55" and "55.", which represent the age in the first sentence.

```
str_view_all(out, "\\s\\d{2}\\.")  # 2 digits then "."
```

[1] | My SSN is 593-29-9502 and my age is < 55.> My phone number is 612-643-1539. My old

19.1.4 d. Use str_view_all to determine the correct regex pattern to identify all SSN in out

We can get the SSN with the usual format (###-#####) with a regex that has 3, 2, and 4 digits separated by a dash.

```
str\_view\_all(out,"([0-8]\d{2})-(\d{2})-(\d{4})")
```

[1] | My SSN is <593-29-9502> and my age is 55. My phone number is 612-643-1539. My old

This misses the oddly formatted SSN in the third entry. Rather than use a dash, we can specify the divider as [-\\s]? which allows either 0 or 1 occurrences of either a dash or space divider:

```
str_view_all(out,"([0-8]\d{2})[-\s]?(\d{2})[-\s]?(\d{4})")
```

[1] | My SSN is <593-29-9502> and my age is 55. My phone number is 612-643-1539. My old SSN number

Click for answer

Click for answer

answer:

The first pattern finds the SSNs in the standard format (###-#####) by searching for 3 digits, a dash, 2 digits, another dash, and 4 digits. The second pattern does the same but allows for a space instead of a dash as a divider. It finds all SSNs in out, including the oddly formatted one in the third sentence.

19.1.5 e. Write a regular expression to extract dates in the format YYYY-MM-DD from a given text.

```
date_pattern <- "\\d{4}-\\d{2}-\\d{2}"
text <- "The event will take place on 2023-07-20 and end on 2023-07-22."
str_extract_all(text, date_pattern)

[[1]]
[1] "2023-07-20" "2023-07-22"</pre>
```

Answer: The pattern searches for 4 digits, a dash, 2 digits, another dash, and 2 digits. In the given text, it finds the dates "2023-07-20" and "2023-07-22".

19.1.6 f. Write a regular expression to extract all words that start with a capital letter in a given text.

```
capital_pattern <- "\\b[A-Z][a-zA-Z]*\\b"
text <- "Alice and Bob went to the Market to buy some Groceries."
str_extract_all(text, capital_pattern)

[[1]]
[1] "Alice" "Bob" "Market" "Groceries"</pre>
```

Click for answer

Answer: The pattern searches for a word boundary, followed by an uppercase letter, and then any sequence of letters. In the given text, it finds the words "Alice", "Bob", "Market", and "Groceries".

19.1.7 g (Optional) Create a regular expression to match URLs, considering both http and https protocols.

```
url_pattern <- "https?://(?:[a-zA-Z0-9-]+\\.)+[a-zA-Z]{2,}(?::\\d+)?(?:/\\S*)?"
urls <- c("https://www.example.com", "http://example.org/resource?query=123", "invalid_str_view(urls, url_pattern)</pre>
```

- [1] | <https://www.example.com>
- [2] | http://example.org/resource?query=123

Click for answer

Answer: The pattern searches for either "http://" or "https://", followed by one or more domain segments separated by periods, an optional port number, and an optional path. In the given urls, it matches the first two valid URLs but not the invalid one.

https?://: This part matches the URL protocol (http or https). The ? means that the preceding character "s" is optional. (?:[a-zA-Z0-9-]+\\.)+: This part matches the domain name. The (?:) is a non-capturing group, and [a-zA-Z0-9-]+ matches one or more alphanumeric characters or hyphens. The \\. matches a period (dot), and the + outside the group means that the pattern inside the group should occur one or more times. [a-zA-Z]{2,}: This part matches the top-level domain (TLD), such as .com or .org, which has at least two alphabetic characters. (?::\\d+)?: This part is an optional group that matches a colon followed by one or more digits. It is used to specify a port number in the URL. The ? outside the group makes it optional. (?:/\\S*)?: This part is another optional group that matches a forward slash followed by zero or more non-whitespace characters (representing the URL path). Again, the ? outside the group makes it optional.

19.2 Group Activity 2

19.2.1 a. Let's deal with a number string that is longer than 9 digits.

```
ssn <- "([0-8]\\d{2})[-\\s]?(\\d{2})[-\\s]?(\\d{4})"
test <- c("123-45-67890","1123 45 6789")
str_view_all(test, ssn)</pre>
```

- [1] | <123-45-6789>0
- [2] | 1<123 45 6789>

This example captures a 9-digit string as an SSN, but these strings are longer than 9 digits and may not represent an SSN. One way to deal with this is to use the negative lookbehind ?<! and negative lookahead ?! operators to ensure that the identified 9-digit string does not have a leading 0 or does not contain more digits.

If we "look behind" from the start of the SSN, we should not see another digit:

```
str\_view\_all(test, "(?<!\d)([0-8]\d{2})[-\.\s]?(\d{2})[-\.\s]?(\d{4})")
```

- [1] | <123-45-6789>0
- [2] | 1123 45 6789

And if we "look ahead" from the end of the SSN, we should not see another digit:

```
str\_view\_all(test, "(?<!\d)([0-8]\d\{2\})[-\.\s]?(\d\{2\})[-\.\s]?(\d\{4\})(?!\d)")
```

- [1] | 123-45-67890
- [2] | 1123 45 6789

For parts b and c, consider the following string.

```
string1 <- "100 dollars 100 pesos"
```

19.2.2 b. Explain why the following matches the first 100 and not the second.

Click for answer

answer: It looks for one or more digits followed by a space and dollars

str_view(string1, "\\d+(?= dollars)")

[1] | <100> dollars 100 pesos

19.2.3 c. Explain why the following matches the second 100 and not the first.

Click for answer

answer: It looks for one or more digits not followed by either a digit or space followed by dollars

```
str_view(string1, "\\d+(?!\\d| dollars)")
```

[1] | 100 dollars <100> pesos

For parts d and e, please take a look at string2.

```
string2 <- "USD100 PES0100"
```

19.2.4 d. Explain why the following matches the first 100 and not the second.

Click for answer

answer: It looks for exactly 3 digits preceded by USD

```
str_view(string2, "(?<=USD)\\d{3}")
```

[1] | USD<100> PESO100

19.2.5 e. Explain why the following matches the second 100 and not the first.

Click for answer

answer: It looks for exactly 3 digits that is not preceded by USD

```
str_view(string2, "(?<!USD)\\d{3}")
```

[1] | USD100 PESO<100>

19.3 Group Activity 3

tweets<- read_csv("https://raw.githubusercontent.com/deepbas/statdatasets/main/TrumpTweetData.csv</pre>

19.3.1 a. What proportion of tweets (text) mention "America"?

19.3.2 b. What proportion of these tweets include "great"?

```
tweets %>% filter(str_detect(str_to_title(text), "America")) %>%
   summarize(prop = mean(str_detect(str_to_lower(text), "great")))

# A tibble: 1 x 1
   prop
   <dbl>
1   0.4

Click for answer

Answer: About 40% of tweets mention "great".
```

19.3.3 c. What proportion of the tweets mention @?

Click for answer

```
tweets %>% mutate(ct = str_count(text, "@")) %>%
   select(text, ct) %>%
   summarize(prop = mean(ct>0))

# A tibble: 1 x 1
   prop
   <dbl>
1 0.317

Click for answer

Answer: About 32% of tweets mention @.
```

19.3.4 d. Remove the tweets having mentions Q.

```
Mentions <- c("@[^\\s]+")

tw_noMentions <- tweets %>% mutate(textNoMentions = str_replace_all(text, Mentions, ""
tw_noMentions$text[38]

[1] "My daughter @IvankaTrump will be on @Greta tonight at 7pm. Enjoy! https://t.co/Qystw_noMentions$textNoMentions[38]

[1] "My daughter will be on tonight at 7pm. Enjoy! https://t.co/QySC5PLFMy"
```

Answer: @: This part of the pattern matches the "@" symbol, which usually indicates the beginning of a mention in a tweet. $[\]$ \s]+: This part of the pattern matches one or more characters that are NOT whitespaces. The `nside the square brackets [] negates the character class (meaning it matches any character that is NOT in the specified class). The double backslash \\ is used to escape the backslash in the R string, so the pattern \\s represents the whitespace character class \s. Finally, the + indicates that the pattern should match one or more occurrences of the non-whitespace characters. Together, this regular expression pattern @[^\\s]+ matches any mention in a tweet, which usually starts with "@" followed by one or more non-whitespace characters.

19.3.5 e. What poportion of tweets originated from an iPhone?

```
tweets %>% group_by(source) %>% summarize(count = n()) %>%
  mutate(prop = count / sum(count)) %>% filter(source == "iPhone")
```

A tibble: 1 x 3
 source count prop
 <chr> <int> <dbl>
1 iPhone 628 0.415

Click for answer

Answer: About 42% of the tweets originated from an iPhone.

Chapter 20

Class Activity 14

load the necessary libraries

library(wordcloud)

library(reshape2)

library(tidyverse)

library(tidyr)

library(tidytext)

library(dplyr)

20.1 Group Activity 1

20.1.1 a. Variance and Skewness

The variance of a random variable x is defined as:

$$\mathrm{Var}(x) = \frac{1}{n-1} \sum_{i=1}^n \left(x_i - \bar{x}\right)^2$$

where $x_i = (\sum_i^n x_i)/n$ is the sample mean. Also, the skewness of the random variable x is defined as:

$$\mathrm{Skew}(x) = \frac{\frac{1}{n-2} \left(\sum_{i=1}^{n} \left(x_i - \bar{x} \right)^3 \right)}{\mathrm{Var}(x)^{3/2}}$$

Please write functions to calculate the variance and skewness of {12, 45, 54, 34, 56, 30, 67, NA}.

```
x <- c(12, 45, 54, 34, 56, 30, 67, NA)

Click for answer

# function to calculate the variance of a vector

var <- function(x){
    x <- na.omit(x) # omit NA values
    sum((x - mean(x)) ^ 2) / (length(x) - 1)
}

var(x)

[1] 346.619

# function to calculate the skewness of a vector

skewness <- function(x) {
    x <- na.omit(x) # omit NA values
    sum((x - mean(x)) ^ 3) /((length(x) - 2) * var(x) ^ (3 / 2))
}

skewness(x)</pre>
```

20.1.2 b. Conditions and breaks

Create a function that iterates through a numeric vector and stops when it encounters the first negative number, returning the position of that negative number. If there are no negative numbers in the vector, the function should return a message stating that there are no negative numbers.

Click for answer

[1] -0.3930586

```
find_first_negative <- function(x) {
  negative_positions <- which(x < 0)

if (length(negative_positions) > 0) {
    return(paste("The first negative number is at position", negative_positions[1]))
} else {
    return("There are no negative numbers in the vector")
}
```

```
test_vector <- c(5, 12, -7, 20, 15)
find_first_negative(test_vector)</pre>
```

[1] "The first negative number is at position 3"

20.2 Group Activity 2

```
musical_instr_reviews <- read_csv("https://raw.githubusercontent.com/deepbas/statdatasets/main/n
  rename(ratingOverall = overall)
glimpse(musical_instr_reviews)

Rows: 10,261
Columns: 3
$ reviewerName <chr> "cassandra tu \"Yeah, well, that's j~
```

20.2.1 a. Write a function to filter the dataset based on

the provided rating:

Click for answer

```
filter_reviews_by_rating <- function(data, rating) {
  data %>% filter(ratingOverall == rating)
}
```

20.2.2 b. Write a function to process the text and remove stop words:

Click for answer

```
process_text <- function(data) {
  data %>%
    select(reviewText) %>%
    unnest_tokens(output = word, input = reviewText) %>%
    anti_join(stop_words)
}
```

20.2.3 c. Write a function to join the processed text with sentiment data and create a word count table.

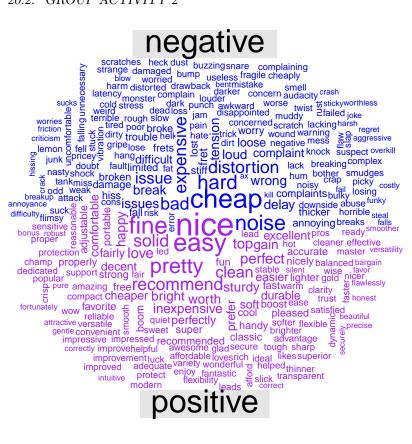

Click for answer

```
create_word_count_table <- function(data) {
  data %>%
    inner_join(get_sentiments("bing")) %>%
    count(word, sentiment, sort = TRUE) %>%
    reshape2::acast(word ~ sentiment, value.var = "n", fill = 0)
}
```

20.2.4 d. Create the final function that takes the rating and number of words as input arguments and returns a word cloud plot.

Click for answer

```
word_cloud <- function(rating, num.words) {</pre>
  rating <- as.numeric(rating)</pre>
  num.words <- as.numeric(num.words)</pre>
  if (rating >= 1 & rating <= 5) {</pre>
    filtered_reviews <- filter_reviews_by_rating(musical_instr_reviews, rating)</pre>
    processed_reviews <- process_text(filtered_reviews)</pre>
    word_count_table <- create_word_count_table(processed_reviews)</pre>
    comparison.cloud(
      word_count_table,
      colors = c("blue", "purple"),
      scale = c(2, 0.5),
      max.words = num.words,
      title.size = 2
    )
  } else {
    warning(" Please enter a rating from 1 to 5")
}
word_cloud(rating = "4", num.words = 300)
```

Chapter 21

Class Activity 15

21.1 Group Activity 1

21.1.1 a. if and for loop

Write a for loop to iterate over the columns of the 'energy' dataset and print the names of all columns containing the string "House". Please use the function colnames() to extract the column names and store the results in a list.

Click for answer

```
# Create an empty list to store the column names
house_columns <- list()</pre>
```

```
# Iterate over the columns of the 'energy' dataset
for (i in seq_along(colnames(energy))) {
  col_name <- colnames(energy)[i]</pre>
  # Check if the column name contains the string "House"
  if (str_detect(col_name, "House")) {
    # Add the column name to the list
    house_columns[[length(house_columns) + 1]] <- col_name</pre>
  }
}
# Print the list of house columns
house_columns <- unlist(house_columns)</pre>
house_columns
 [1] "Allen_House"

3. Reshape the data frame to make variables stat (describing the quantile), building and quant (quantile value)

Click for answer

Answer:

```
qdf <- energy %>% select(9:90) %>%
  map_dfc(quantile, probs = seq(.1,.9,.1), na.rm = TRUE) %>%
  mutate(stat = str_c("quantile_", seq(10,90,10))) %>%
  pivot_longer(names_to = "building", values_to = "quantiles", 1:82)
qdf
```

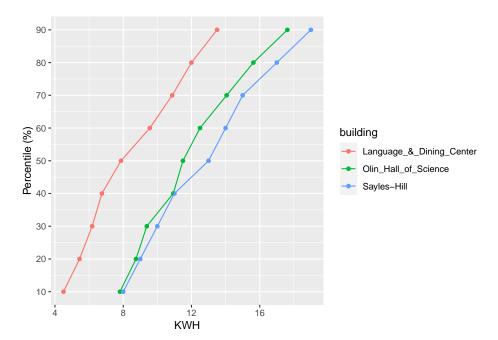

```
# A tibble: 738 x 3
```

01001000		
stat	building	quantiles
<chr></chr>	<chr></chr>	<dbl></dbl>
1 quantile_10	100_Nevada_Street	0.0972
2 quantile_10	104_Maple_St.	1.04
3 quantile_10	106_Winona_St.	0.601
4 quantile_10	Allen_House	0.756
5 quantile_10	Alumni_Guest_House/Johnson_House	17.0
6 quantile_10	Arboretum_Office	0.13
7 quantile_10	Art_Studios	0.23
8 quantile_10	Benton_House	1.59
9 quantile_10	Berg_House	1.06
10 quantile_10	Bird_House	1.42
# with 728	more rows	

4. Plot the KWH value for each quantile on the x-axis for the buildings Sayles-Hill, Language_&_Dining_Center, Olin_Hall_of_Science

Click for answer

```
qdf %>%
  filter(building %in% c("Sayles-Hill" ,"Language_&_Dining_Center",
    ggplot(aes(x=quantiles, y=parse_number(stat), color=building)) +
    geom_point() +
    geom_line(aes(group=building)) +
    labs(y="Percentile (%)",x="KWH") +
    scale_y_continuous(breaks=seq(10,90,by=10))
```

Helpful R codes

22.1 Residual Plots in ggplot2

```
# residual size plot
library(ggplot2)
bac <- read.csv("https://raw.githubusercontent.com/deepbas/statdatasets/main/BAC.csv")</pre>
fit <- lm(BAC ~ Beers, data = bac) # fit the model</pre>
bac$predicted <- predict(fit) # Save the predicted values</pre>
bac$residuals <- residuals(fit) # Save the residual values
ggplot(bac, aes(x = Beers, y = BAC)) +
  geom_smooth(method = "lm", se = FALSE, color = "lightgrey") +
                                                                     # regression line
  geom_segment(aes(xend = Beers, yend = predicted), alpha = .2) +
                                                                        # draw line from point to
  geom_point(aes(color = abs(residuals), size = abs(residuals))) + # size of the points
  scale_color_continuous(low = "green", high = "red") +
  labs(title = "BAC Vs. Beers") +# color of the points mapped to residual size - green smaller, a
  guides(color = FALSE, size = FALSE) +
                                                                     # Size legend removed
  geom_point(aes(y = predicted), shape = 1, size = 2) +
  scale_x_continuous(breaks=1:9)+
  theme(axis.text=element_text(size=10),
        axis.title=element_text(size=10,face="bold"),
        plot.title = element_text(size = 10, face = "bold"))
```

22.2 Plotly codes

```
plot_ly(data, x = ~Gender, y = ~In_a_relationship, type = 'bar', name = 'In a relations
  add_trace(y = ~Its_complicated, name = 'It\'s complicated') %>%
  add_trace(y = ~Single, name = 'Single') %>%
  layout(yaxis = list(title = 'Number of People'), barmode = 'group')
```
